Installation

Install Ruby (incl. Devkit)	https://rubyinstaller.org/downloads/
Install Rails	`gem install rails`
Install git	https://git-scm.com/downloads

Verify installed version

Verify Ruby version	`ruby -v`
Verify Rails version	`rails -v`
Verify git version	`git --version`

Create a new project

Select directory	`cd <di rec tor y>`
Create new Rails project	`rails new <pr oje ct_ nam e>`
Select new project directory	`cd <pr oje ct_ nam e>`
Create and migrate database	`rails db:prepare`
Initialize a new Git repository for version control	`git init`
Add all files Git staging area	`git add .`
Commit staging files to Git repository	`git commit -am " Initial commit "`

You've now created a project and committed it to a Git repository. Additionally, you could also set up a remote repository on GitHub.

Generate a model

Generate model	`rails generate model <mo del _na me> <at tr: e2> :<t ype>`
Apply migration and create table	`rails db:migrate`
