One Minute Pitch

The study of the tumor microenvironment expands the understanding of the role of the tumor microenvironment in cancer initiation, progression and metastases. Examination of the TME offers a more comprehensive understanding of the composition of the stroma in normal tissues, with the goal of delineating the mechanisms of tumor-stromal interactions in cancer.

Applications

Reactivation of WNT by SOX9 drives PCa: SOX9 has been implicated in PCa but the SOX9-dependent genes and pathways involved are not well known. Ma et al. used SOX9 ChIP-Seq and transcriptome profiling to identify the spectrum of SOX9-related genes and pathways in PCa. RNAscope® ISH validated the microarray results in human PCa samples and showed that SOX9 levels correlated with WNT pathway components. http://bit.ly/2q9JrDB

Correlation of the lncRNA SChLAP1 with PCa disease progression: Mehra et al. used RNAscope® ISH to demonstrate that PCa patients with high expression of the lncRNA SChLAP1 had a significantly higher chance of developing lethal disease, suggesting SChLAP1 could be a tissue-based prostate cancer biomarker. http://bit.ly/2qHzfFn

Identification of the cellular localization of the secreted factor IL6 in PCa: IL6 is known to contribute to the development and/or progression of PCa. Yu et al. used RNAscope® ISH to reveal that IL6 expression was nearly exclusively restricted to the prostate stromal compartment. http://bit.ly/2qOGp93

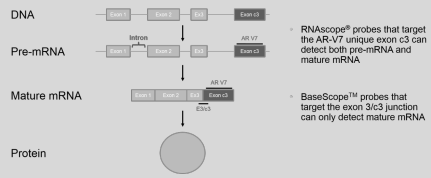
Special Case: AR-V7 - CRPC

Despite removal of the prostate and a reduction in androgen levels, some cases of prostate cancer still rely on androgen signaling
--> Known as castration-resistant prostate cancer (CRPC)
Many drug therapies for CRPC focus on attenuating androgen pathway
--> Enzalutamide and Abiraterone
20-40% of CRPC patients have no response to these drugs
--> Referred to as drug-resistant CRPC or androgen-independent CRPC
Correlation between drug-resistant CRPC patients and AR-V7 status

BaseScope and RNAscope probes for AR detection



AR-V7 Detection Methods

Detection method	Target specimen	Pros	Cons
RT-PCR	Fresh frozen primary tumor, mCRPC autopsies, mCRPC biopsies, liquid biopsies such as CTC	Highly sensitive	Sensitivity lower in FFPE tissues
RISH	FFPE or fresh frozen mCRPC specimens	*In situ* visualization of mRNA	Sometimes pre-mRNA is detected[#]
RNA-Seq	Fresh frozen mCRPC specimens	High quantitative capacity	Expensive
Western Blot	Fresh frozen mCRPC specimens	Allows for protein detection	Requires tissue in high quantity
IHC/IF	FFPE or fresh frozen mCRPC specimens	*In situ* visualization of protein	Current antibodies not robust enough
