

File Expressions

<i>file1</i> - ef <i>file2</i>	<i>file1</i> and <i>file2</i> have the same inode numbers (the two filenames refer to the same file by hard linking).
<i>file1</i> - nt <i>file2</i>	<i>file1</i> is newer than <i>file2</i> .
<i>file1</i> - ot <i>file2</i>	<i>file1</i> is older than <i>file2</i> .
-b <i>file</i>	<i>file</i> exists and is a block-special (device) file.
-c <i>file</i>	<i>file</i> exists and is a character-special (device) file.
-d <i>file</i>	<i>file</i> exists and is a directory.
-e <i>file</i>	<i>file</i> exists.
-f <i>file</i>	<i>file</i> exists and is a regular file.
-g <i>file</i>	<i>file</i> exists and is set-group-ID.
-G <i>file</i>	<i>file</i> exists and is owned by the effective group ID.
-k <i>file</i>	<i>file</i> exists and has its "sticky bit" set.
-L <i>file</i>	<i>file</i> exists and is a symbolic link.
-O <i>file</i>	<i>file</i> exists and is owned by the effective user ID.
-p <i>file</i>	<i>file</i> exists and is a named pipe.
-r <i>file</i>	<i>file</i> exists and is readable (has readable permission for the effective user).
-s <i>file</i>	<i>file</i> exists and has a length greater than zero.
-S <i>file</i>	<i>file</i> exists and is a network socket.

File Expressions (cont)

-t <i>fd</i>	<i>fd</i> is a file descriptor directed to/from the terminal. This can be used to determine whether standard input/output/error is being redirected.
-u <i>file</i>	<i>file</i> exists and is setuid.
-w <i>file</i>	<i>file</i> exists and is writable (has write permission for the effective user).
-x <i>file</i>	<i>file</i> exists and is executable (has execute/search permission for the effective user).

Logical Expressions

AND	-a
OR	-o
NOT	!

Integer Expressions

<i>integer1</i> -eq <i>integer2</i>	<i>integer1</i> is equal to <i>integer2</i> .
<i>integer1</i> -ne <i>integer2</i>	<i>integer1</i> is not equal to <i>integer2</i> .
<i>integer1</i> -le <i>integer2</i>	<i>integer1</i> is less than or equal to <i>integer2</i> .
<i>integer1</i> -lt <i>integer2</i>	<i>integer1</i> is less than <i>integer2</i> .
<i>integer1</i> -ge <i>integer2</i>	<i>integer1</i> is greater than or equal to <i>integer2</i> .
<i>integer1</i> -gt <i>integer2</i>	<i>integer1</i> is greater than <i>integer2</i> .

String Expressions

<code>string</code>	<code>string</code> is not null.
<code>-n string</code>	The length of <code>string</code> is greater than zero.
<code>-z string</code>	The length of <code>string</code> is zero.
<code>string1 = string2</code> <code>string1 == string2</code>	<code>string1</code> and <code>string2</code> are equal.
<code>string1 != string2</code>	<code>string1</code> and <code>string2</code> are not equal.
<code>string1 > string2</code>	<code>string1</code> sorts after <code>string2</code> .
<code>string1 < string2</code>	<code>string1</code> sorts before <code>string2</code> .

Modern Version of test

Instead of using [**expression**] is going to be [[**expression**]] and one designed for integers is ((**expression**)).

With [[**expression**]] we can have an expression matching a regular expression:

```
string =~ regex.
```

For the integers in this way we can use the conventional way of other programming languages expressions like:

```
int == 0.
```

```
int < 0.
```

```
int > 0.
```

```
int % 0.
```

And of course the logical operators, instead of using the older options of test we can use:

&& for and.

|| for or.

! for not.
