

Quantitative Reasoning

- compare to explain or show the similarities or differences between items or ideas
- scenario an imagined or projected sequence of events
- constant a number or a variable whose value does not change
- quantity measurable attribute of a thing or event
- rate a ratio comparing quantities measured in different units

Labeling

Example finding angle

Example: For his workout, Miguel ran uphill for a while, reached the top, rested a few minutes to take a drink of water, and then ran back down the hill. Compare the graphs below and determine which one accurately represents Miguel's workout.

Circle the correct graph.

When Miguel runs back down the hill, that means distance is still increasing. He's traveling additional distance. If he's traveling additional distance, the distance needs to go **up**.

speed and time

Comparing Speed and Time

Example: Compare the plotted graphs of two cars' speed versus time, with both cars starting from the same location.

Defining terms

- ray part of a line that has one endpoint and extends indefinitely in one direction
- line a part of a line that has two endpoints and a specific length
- perpendicular lines lines that intersect to form right, or 90-degree, angles
- parallel lines lines that lie in the same plane and do not intersect

Undefined Geometric terms

Defining mathematical terms

Rays and Line Segments

Rays and Line Segments

Example: Identify the rays and line segments shown in the diagram.

Example

Miranda has 55 feet of fencing. She wants to use all the fencing to create a rectangular garden. The equation $2l + 2w = 55$, where l is the length of the garden and w is the width, models the scenario. This equation can be used to find one dimension of the garden if the other dimension is known.

If Miranda makes the garden 17.5 feet long, how wide should she make it?

1. **Substitute** 17.5 for l . $2(\mathbf{17.5}) + 2w = 55$
2. Simplify. $35 + 2w = 55$
3. Use the properties of equality to solve for w . $-35 \quad -35$
 $0 + \frac{2w}{2} = \frac{20}{2}$
 $w = \mathbf{10}$ ft

Writing and Graphing Equations in Two Variables

- assume to accept as true without proof
- viable capable of working successfully; practical, realistic, usable, possible
- continuous graph a graph in the coordinate plane made up of connected lines or curves with no breaks
- coordinate plane a graph that has a finite number of data points
- ordered pair the pair of numbers, given in a specific order used to locate a point a coordinate plane

Continuous vs. Discrete Graphs

Time and distance can be fractional.

The number of tickets must be a whole number.

Introduction to Functions

- range the set of output values corresponding to the domain values
- dependent variable the variable in a function that represents the output values; the second coordinate in the ordered pairs

Writing and Solving Equations in Two Variables

$$\frac{x}{6} - 4.2 = 3$$

$$+ 4.2 \quad + 4.2$$

$$\mathbf{6} \left(\frac{x}{6} \right) = 7.2 \left(\mathbf{6} \right)$$

$$x = \mathbf{43.2}$$

Check: $\frac{\mathbf{43.2}}{6} - 4.2 = 3$

$$7.2 - 4.2 = 3$$

$$\mathbf{3} = 3$$

Introduction to Functions (cont)

- function** a relation in which each element of the domain is mapped to (paired with) exactly one element of the range
- domain** the set of input values for which the function is defined
- relation** a set of ordered pairs
- independent variable** the variable in a function that represents the input values; the first coordinate in the ordered pairs

Creating an Input/Output Table of Values

Create a table of input and output values for the equation $y = 5 + 3x$.

Inputs	Outputs
$x = -2$	$y = 5 + 3(-2) = -1$
$x = -1$	$y = 5 + 3(-1) = 2$
$x = 0$	$y = 5 + 3(0) = 5$
$x = 1$	$y = 5 + 3(1) = 8$
$x = 2$	$y = 5 + 3(2) = 11$

Creating an Input/Output Table of Values

Domain is x-axis, while Range is y-axis

Is it a function? Do the vertical line test

If any **vertical** line passes through no more than one point, then the graph represents a function.

Definitions

- discrete graph** a graph that has a finite or limited number of data points
- function notation** a notation that traditionally replaces the dependent variable in a function with $f(x)$, where f represents the value of the dependent variable at a given independent value, x
- continuous graph** a graph in the coordinate plane made up of connected lines or curves with no breaks

Function Notation

The meaning of

Write a notation yourself

Using the Problem-Solving Process to Write a Function

REAL-WORLD CONNECTION

A tablet has 32 gigabytes of storage available, and each video download requires 2 gigabytes. The amount of storage left in gigabytes is represented by the variable s , and the number of videos downloaded is represented by the variable v .

Write a function that models the relationship between storage left and number of videos downloaded.

Question Write a function that models the relationship between storage left and number of videos downloaded.

Clues

Tablet \rightarrow **32 GB available** Each video \rightarrow **2 GB**

Strategy

The amount of storage **depends** on the number of videos downloaded.

Input variable \rightarrow **v** Output variable \rightarrow **s**

Equation: **$s = 32 - 2v$** Function: **$t(v) = 32 - 2v$**

Check

5 videos \rightarrow 22 GB
Check the function when the number of videos is 5:

$$\begin{aligned} t(5) &= 32 - 2(5) \\ t(5) &= 32 - 10 \\ t(5) &= 22 \end{aligned}$$
