

Cheatography

Python Cheat Sheet by Anon123 via cheatography.com/25787/cs/6921/

Vocabulary

variable	something that can change
string	a list of characters
integer number	pos/neg natural numbers and zero
floating point	decimal number
length	the length of the string
Modulo	Finds the remainder
Boolean	True/False
Syntax	Grammar/Structure of language
range (1,10)	the numbers 1-9
range(10)	the numbers 0-10

Conditionals

If.....	If the statement is true then do
:then.....	command under then else do
else.....	command under else
while.....	While this is true loop the command under the conditional
While	loops forever
True	
for each item in name of list	For every item in the list repeat the command under the loop that many times. (a string is a list too)

Naming Conventions

Rules for naming variables:

- letters
- numbers
- underscores (_)
- can start with **letters or underscores ONLY**
- NO SPACES

Valid names:

- _mystr
- my3

Hello_there

Invalid names:

- 3my= "hi" -- cannot start with number
- first name = "hi" -- no spaces allowed
- first-name -- dashes are not accepted

Lists

```
#this is how you make a list in python
shoppi nglist = ['coke zero', 'bacon', 'water', 'jelly', 'gummy bears']
print (shopp ing list)
print (shopp ing lis t[0])
#prints the first item of the list
list_num = 0
while list_num < len(sh opp - ing list):
    print ("Li st: ", shoppi ngl ist [li st_ num])
    lis t_num =list_ num+1

#for loop--> same as the above
#For every item in that list we're going to print it.
for item in shoppi nglist:
    print (item)
numbers = range(1,5)
#print up until less than the last number.
for item in numbers:
    print (item)
# a string is a list of characters, letters, numbers, etc.
mystr = " hel lo"
for letter in mystr:
    print (letter)
```

Adding strings number

```
mystring = ""
count = 0
while count < 5:
    mys tring = mystring + str(count)
    print (mystring)
    count = count + 1
```

Symbols

Symbols (cont)

//	divide and quotient is integer
**	exponent
%	modulo: the remainder
[...]	The position of the item in the list or the letter in a word

Multiplication & Exponents

string * string	CRASH!!!
string *	combines the strings
number	multiple time
number *	math (multiply)
number	
string **	CRASH!!!
number	
number **	Exponent(Math)
number	
string **	CRASH!!!
number	

Even/odd using counters

```
even_value = 0
odd_value = 0
while True:
    use r_input = input(" - Enter a positive number: ")
    number = int(us er_ - input)
    if number < 0:
        print ("There were ", even_value , "even numbers and there were " , odd_value , "odd number s.")
        break
    if number % 2 == 0:
        even_value =
even_value + 1
    else:
        odd _value =
odd_value +1
```

Addition

string + string	squishes them together
string + number	crash
number + number	math(addition)

Area of circle

By **Anon123**

cheatography.com/anon123/

==	equal to
!=	not equal to
<	less than
<=	less than or equal to
>	greater than
>=	greater than or equal to
+	add
-	subtract
*	multiply
/	divide and quotient is float

```
def areaofCircle(r):  
    if r <= 0:  
        return " Error:  
invalid radius "  
  
    pi = 3.1415
```

Cheatography

Python Cheat Sheet by Anon123 via cheatography.com/25787/cs/6921/

Area of circle (cont)

```
> area = pi(*2)
   return (area)
user_radius = input('Enter the radius: ')
radius = float(user_radius)
print("The area of the circle is", areaofCircle(radius))
```

fibonacci

```
num1= 0
num2=1
mystr = '0'
while num1 + num2 < 89:
    Fib onacci = num1 +num2
    num1= num2
    num 2=F ibo nacci
    mystr= mystr+ " ,"
    str(num1)
print (mystr)
```

Functions

Functions

print()	displays information on the screen
input()	receives info from the user
int()	converts the value into an integer
str()	converts the value to a string
float()	converts the value to a floating point
len()	The length of the string
#	One line comment not include in code
'''	Multi-line comment
def	defines a block as in subbing the name(v
	name for lines of commands. The variable in the parentheses can be replaced by inputing the desire value into those parentheses.
range	range of numbers from 0 to one
(100)	less then that.

Spelling a string out in reverse code

```
word = input("Type in an word:")
")
reverse = " "
for letter in word:
    reverse = letter +
reverse
print ("Re verse: ", reverse)
```

This prints the true or false value using boolean

```
print(True)
print (2<3)
print (2 != 2)
```

Countdown Code

```
user_number = input("Please enter a number: ")
number = int(user_number)
countdown_string = " "
while number > 0:
    countdown_string =
countdown_string + " " +
str(number)
    number = number-1
print (countdown_string)
```

palindrome and efficient loops

```
def isPalindrome (word):
    let letter_num =0
    while letter_num <
len(word) -1- let letter_num:
        if word[letter_num] == word[letter_num-1]:
            let -
letter_num = letter_num +1
        else:
            return
False
return True

while True:
    use r_input = input(" - Please type in a word: ")
    if user_input == "qui - t":
        break
    #print (isPalindrome (user _in put))
    myvalue = isPalindrome (user _input)
    if myvalue == True:
        print (user _input + " is a palindrome .")
    elif myvalue == False:
        print (user _input + " is not a palindrome .")
```

list loops #2

```

def calc(num1, num2, operation):

    if operation == " sum ":
        return sum(num1,
num2)

    elif operation == " pro -
duc t":
        return produc -
t(num1, num2)

    elif operation == " dif -
f":
        return
diff(num1, num2)

    elif operation == " -
div ":
        return div(num1,
num2)

```

```
def sum(a, b):
    return a+b
```

```
def product(a, b):
    return a*b
```

```
def diff (a, b):
    return a-b
```

```
def div(a, b):
    if b == 0:
        return ("Er -
ror ")
    elif b != 0:
        return a/b
```

```

print (calc( 1,2 , "su m"))
print (calc(4,2, " dif f"))
print (calc (9,0, " div "))
print (calc (2,12, " pro duc -
t"))
calc(1, 2, " sum ")

```

```

word = input("Type in an word:
")

reverse = " "
for letter in word:
    reverse = letter +
reverse
" " "
letter_num = 0
reverse = ''
while letter_num < len(word):
    reverse = (word[ let -
ter _num] + reverse)
    let ter_num = letter_num
+ 1
" " "
print ("Re verse: ", reverse)

```
