React

What is the difference between ‹a› and ‹link› Tag?

React

What is the difference between ‹a› and ‹link› Tag?	what is JSX?
when you are already in a route that matches what the Link points to. Say we are currently on /page and the Link points to /page or even /page/:id, this won't trigger a full page refresh while an ‹a /› tag naturally will	Javscript Expressions. It also makes easier to create React components. JSX allows to put HTML in javascript.

Programmatic Redirection in React Router

It can be achieved by ‹Redirect/› Tag or history.push from the history library in React Router. When a component is rendered by the **React Router** three props are passed to the components *location* , *History* and *match*. In which **history.push** pushes a new route to the history stack aka routing the user to the new route.
