### React

What is the difference between `<a>` and `<link>` Tag?

when you are already in a route that matches what the Link points to. Say we are currently on <code>/page</code> and the Link points to <code>/page</code> or even <code>/page/id</code> , this won't trigger a full page refresh while an <code>&lt;a /&gt;</code> tag naturally will	Javascript Expressions. It also makes easier to create React components. JSX allows to put HTML in javascript.

### Programmatic Redirection in React Router

It can be achieved by `<Redirect/>` Tag or `history.push` from the history library in React Router. When a component is rendered by the **React Router** three props are passed to the components `location`, `History` and `match`. In which `history.push` pushes a new route to the history stack aka routing the user to the new route.
