

Counting

Permute = $nPr = n! / (n - r)!$

Combinations = $nCr = n! / r!(n - r)!$

Circular Permutation = $n!/n$ (eg, 6 ppl around tables = 5!)

Inclusion-Exclusion Principle: if there are cases when both things are done together, we need to subtract the number of ways to do both from the sum.

Complexity

Algorithms:

- Precise: they must be written in terms understandable by anyone

- Effective: a step must help the algorithm progress to the final goal

- Practical: a sequence of precise and effective steps may not be useful in practice
