

Process/Method

Refers to the tasks carried out during a project

step-by-step description of the steps involved in doing a particular job

A method is specific to one project

Why Methodology?

Refers to the general framework and principles used to organise the tasks

Techniques of system development must be organized

A metaprocess that can be applied to many projects

A methodology is instantiated on a project

set of general principles that guide the choice of a method suited to a specific task or project

Typical product: A range of business software applications

Advantages

- Helps produce better quality product
- Better documented software
- More acceptable to user
- More maintainable software
- More consistent software
- Helps ensure user requirements are met
- Helps project manager control the project
- Reduces development costs
- Promotes communication among all parties

USDP

Unified Software Development Process

Largely superseded by Rational Unified Process

Main principles:

- Use-case driven

- Architecture-centric

- Iterative development

- Incremental development
