above the others. SpriteRender Components can belong to Sorting Layers, which define the rendering order for sprites. Camera Components can see or not Sorting Layers by setting the Culling Mask

Game Objects and Components

Game Object	Basic entity in Unity. Can be a 3D or 2D object, a particle or audio or video source, a UI element, or an empty object. Game Objects are just containers for Components. Scripts can be attached to Game Objects, to define their behavior and properties. Game Objects in your scene are represented in the Hierarchy
Component	Basic entities that implement functionalities inside Game Objects
Component in the Inspector	Each Component has a small header bar with: Turn down arrow, Icon, (De)activate checkbox, Reference book (opens online manual), Preset button, Options gear (allows to copy and paste Components). Under the bar are all the Component's properties

Game Objects and Components (cont)

Prefab	Blueprint for Game Objects. You can make a Prefab out of a Game Object. The Prefab will be like a "model" from which you can instantiate new identical copies of that object in your game. Modifying the Prefab properties will modify all Game Objects instantiated from it
Parent/ Child	Any Game Object can have other Game Objects as children. The Transform of a child Game Object will be relative to the parent's Transform. If you make a Prefab out of a Game Object with children, all the hierarchy will be copied. You can see parent/child relationships in the Hierarchy
Usage	
Create	Right click on the Hierarchy > select

reate Right click on the Hierarchy > select new the Game Object type Game Object

Game Objects and Components (cont)		
Set the name from the Inspector (upper part), or from slow double click on the object in the Hierarchy		Dead Gam Object
Assign custom Tags to Game Objects from the Inspector (upper part)		Game Objecthe
In the Hierarchy, drag a Game Object over another		Inspe
Inspector > Add Component		
Drag the Game Object from the Hierarchy to the Project window		
Drag the Prefab from the Project to the Scene view or the Hierarchy		
If you select a Prefab from the Project, and you modify its properties/components, all objects of that type will be modified. On the contrary, if you modify a single Game Object, you can then, from the Inspector (upper part) click on Prefab: Apply button to modify the Prefab	•	
	Set the name from the Inspector (upper part), or from slow double click on the object in the Hierarchy Assign custom Tags to Game Objects from the Inspector (upper part) In the Hierarchy, drag a Game Object over another Inspector > Add Component Inspector > Add Component Hierarchy to the Project from the Hierarchy to the Project window Drag the Prefab from the Project to the Scene view or the Hierarchy I fyou select a Prefab from the Project, and you modify its properties/components, all objects of that type will be modified. On the contrary, if you modify a single Game Object, you can then, from the Inspector (upper part) click on Prefab:	Set the name from the Inspector (upper part), or from slow double click on the object in the Hierarchy Assign custom Tags to Game Objects from the Inspector (upper part) In the Hierarchy, drag a Game Object over another Inspector > Add Component Drag the Game Object from the Hierarchy to the Project window Drag the Prefab from the Project to the Scene view or the Hierarchy If you select a Prefab from the Project, and you modify its properties/components, all objects of that type will be modified. On the contrary, if you modify a single Game Object, you can then, from the Inspector (upper part) click on Prefab:

Game Objects and Components (cont)

ctivate ne ect	Click the tickbox in the upper part of the Inspector
erence	If you define public
ne	GameObject or Component
ect in	(ex: Transform) variables in a
	script, they will be visible as
ector	properties in the Inspector (under
	the Script Component). You can
	assign Game Objects to these
	variables by dragging a Game
	Object from the Hierarchy to the
	field in the Inspector. If the
	variable is of type GameObject,
	you reference the whole Game
	Object. If it is of some Component
	type, instead, you will reference
	that Game Object's Component
	directly instead

Game Objects and Components (cont)

Reference Prefab in the Inspector	The same way you reference a Game Object or a Component in a Script variable from the Inspector, you can drag a Prefab from the Project window to reference it. This is useful for instantiating copies of the Prefab later on
Instantiate Prefab	To instantiate a Prefab from a Script: define a variable of type GameObject or of some Component type. Reference the Prefab from the Inspector. You can now use the Instantiate() function (see API section)

Basic Game Objects and Components

Basic Game Objects

Sprite 2D graphic Game Object. Contains SpriteRenderer component, that manages the rendering of the texture. If you add 2D Colliders and/or 2D RigidBody Components, the Sprite will behave like a physical object

Script Defines custom properties and behavior of a Game Object			function calls). It moves accordingly to its velocity, not affected by forces. Col		
				only with Dynamic bodies	

onents aces an object under control of physics engine, giving it a ody Type (see below), a mass, a w position (overriding the ansform's one), a velocity, an gular velocity, a Material efining drag and bounce), and owing it to be affected by forces ravity, drag, impulse). Attaching Rigidbody to a Sprite makes it have in a physically convincing ιy fines the shape for the purpose collisions. Can be edited by king "Edit Collider". Can be set "Trigger" to emit events dy designed to move. Collides h any body type. Can be ected by forces besn't move (infinite mass). ollides with Dynamic bodies. ves back forces when colliding signed to move (only via ction calls). It moves cordingly to its velocity, but it's affected by forces. Collides

2D Physics (cont)

Spatial coordinate s	The position of a body is identified by a point (Vector3 with 3 coordinates in 3D space, Vector2 in 2D space). In games, the X axis grows from left to right, while the Y grows from top to bottom (it's reversed)
S = V * T	A body with velocity V moves by S in a timestep T
V = A * T	A body with an acceleration A increases its velocity by V in a timestep T
F = m * A	Applying a force F to a body with mass m causes an acceleration A on it
Static drag	If there is a static drag D on a surface, a body cannot move unless you apply a force F > D to it
Dynamic drag	If there is dynamic drag D on a surface, a body moving on it will constantly have a force D <i>opposed</i> to where it's moving
Gravity	If there is a gravitational acceleration g, a body will have a downwards acceleration of g
Trajectory	Curve on which a body moves. A projectile (Angry Bird) with just an initial velocity and in a gravitational field will "draw" a parabula shape. The projectile lands farther if the initial velocity vector was at 45°

2D Physics (cont)		
Angular mechanics	When dealing with rotations, simply substitute: position with angle, velocity with angular velocity, acceleration with angular acceleration, force with torque, drag with angular drag. The laws stay the same	
Scripting		
What is a script	A script is a file containing code (usually C#) that defines the properties and the behavior of a Game Object	
Adding a script	Add a Script to a Game Object from Inspector > Add Component > New script	
Editing a script	Double click on the script in the Inspector. It will be open with your default external editor (Visual Studio, Monodevelop). Then change the script and save it	
Script contents	A script usually has import statements in the upper part, and then the code of a class (with the same name of the file), that contains variables and methods	

Scripting (cont)		
Set variable from Inspector	From the Inspector you can set values for public variables defined in Scripts. For numbers and strings, type directly in. For GameObject or any Component types, drag Game Objects or Prefabs from the editor to the field	
Compiling	Once a script is saved, Unity automatically (re)compiles it. It may take some time (wait for the loading gif in the bar below to disappear)	
Debugging	Compile-time errors and debug logs (outputs of Debug.Log()) are shown in the Console	
Accessing classes from other scripts	If a Script defines apublic class, you can use that class as a reference in any other Script. Ex: the script Enemy contains a reference to the class Player because it needs to chase it	
Documenta tion	From the text editor, select a term and press Ctrl + '	

C#	
Syntax	
stateme nt ;	End every statement with a semicolon
using namespa ce	Include namespace, making new classes available
<pre>class name : father { }</pre>	Define class (inheriting from <i>father</i> class). A class is a blueprint that you can use to instantiate an object: a special variable that contains its own variables (members) and functions (methods)
public field	Make a member or method visible in the Inspector and accessible from other scripts
private field	Deny access from other scripts
// comment	One-line comment
/* multi- line comment */	Multiple line comment
Types	
bool	true or false
int	Integer number
float	Decimal number. Floats always end in f. Ex: 4.5f
string	Text
someTy pe[]	Array containing objects of type someType
Variables	

С

C# (cont)	
int a;	Declaring a variable
a = 5;	Assigning a value
ClassNa	Declaring a reference (variable
me b;	that can contain an object)
Compon	For every Component, there exist
entClas	a class with the same name that
S	you can use to refer to it (ex: Transform)
туСотро	
nent;	
b = new	Instantiating an object
ClassNa	
me();	
object.	Accessing an object's member
variabl	variable
е	
null	Value for null reference (a variable
	referring to no object)
int[]	Create and assign empty array of 5
myList	integers.
= new	
int[5]	
;	
myLlis	Assign a value to an index of an array (indexing starts from 0)
t[0]	andy (macking starts from 0)
= 9;	
Methods	
retType	Method definition. Can take one or
Name(t	more arguments in. You must specify the type of the returned
ype1	object/variable. Use void if there is
arg1,	no return statement
) {	
body	
return	
X; }	
object.	Calling a method
method(
)	

Control flow

By Become A Game Developer (become)

cheatography.com/become/

becomeagamedeveloper.github.io/site

C# (cont)	
<pre>if(condition){ code } else if (condition) { code } else { code}</pre>	Conditional statement
while(<i>condition</i>) { <i>code</i> }	While loop. Executes <i>code</i> until <i>condition</i> is false
for(int i=X; i++; i <n){ code}</n){ 	For loop. Initializes <i>i</i> to <i>X</i> and executes <i>code</i> as long as <i>i</i> < <i>N</i>
foreach(<i>type x</i> in <i>myList</i>){ <i>code</i> }	Executes <i>code</i> looping over <i>myList. x</i> is the current element of the list
Operators	
+ - * / % ? ! ++	Operators (4 operations, modulus, ternary conditional, not, increase, decrease)
< > == != <= >=	Relational operators (lesser, greater, equal, different, less or equal, greater or equal)
cond1 && cond2	'and' operator. True only if both conditions are true
cond1 cond2	'or' operator. False only if both conditions are false
In <i>italics</i> generic or sam	ple terms

Code Flow and Events

Code Flow	Scripts do not run in the traditional manner, looping until they complete a task. Instead, Unity runs the main Game Loop (think of it as a while loop where continuously the following things happen: external input is taken, the game state is updated, objects may be created and destroyed, physics and graphics computations are run, and a new frame is rendered on the screen). When events of a certain type happen, Unity passes control to Scripts by calling the corresponding function. These are called Event Functions
Event Functions	Callback functions that are called by Unity when certain events occur. Event Functions are provided as methods of the MonoBehaviour class, from which the classes in every Script inherit

Published 13th September, 2018. Last updated 13th September, 2018. Page 5 of 8.

Unity 2D Basics Cheat Sheet

by Become A Game Developer (become) via cheatography.com/67591/cs/17006/

Code Flow and Events (cont)	
Trigger Collider	Checkbox you can tick in a Collider Component. If active, the object will emit a <i>trigger event</i> when in contact with something. Triggers are used for non- physical collisions (e.g. detecting when someone enters)
MonoBeha	viour Event Functions
Awake()	Called once before everything else
Start()	Called once after all Awakes, before any Update
Update()	Code that changes the position, state, behavior of objects in game. It is called before each frame is rendered. Updates happen at every iteration of the Game Loop, therefore each update may take a different time. The variable Time.deltaTime always contains the duration of the last update iteration

Code Flor	w and Events (cont)
FixedU pdate(Called before each physics update. The physics engine updates in time steps of fixed duration, therefore you don't have to correct for deltaTimes when moving things inside FixedUpdate. Place physics calls inside this
OnMous e***()	Called when there is a mouse event. *** can be: Down, Enter, Exit, Over, Up, UpAsButton
OnColl ision- ***2D (Colli sion collis ion)	Called when the object is involved in a collision. *** can be: Enter, Stay, Exit (contact is made, held, or broken). The parameter contains info about the collision
OnTrig ger*** 2D(Col lider other)	Called when the object is involved in a collision, only if the object's collider is configured as a Trigger. *** can be: Enter, Stay, Exit. The parameter is the other object's collider
Unity game loop: https://docs.unity3d.com/uploads/Main/monobeha viour_flowchart.svg	

Input	
Input Manager	Access in the editor by Edit > Project Settings > Input. Contains the properties of the Axes
Axes	Axes are virtual directions ("Horizontal", "Vertical", "Jump", "Fire1",) that represent possible inputs. Each Axis has a name, and one or two buttons that are mapped onto the <i>Positive direction</i> and the <i>Negative direction</i> (e.g. "Fire1" only has a button for the Positive input, since there is no concept of <i>firing backwards</i>)
Getting Input	When a player presses an axis button, Unity will set the axis state to a value between -1 and 1 (-1 negative, 1 positive, 0 when there is no input). Get the input by querying Axes. Alternatively, you can query using button names (Keys)
<pre>value = Input. GetAxis ("Horiz ontal");</pre>	Retrieves the current state for the "Horizontal" Axis

Input (co	nt)
value =	Returns true if the user is
Input.Ge	etKey(holding down the key "a"
"a");	
ΑΡΙ	
MonoBeh	aviour
MonoBe	Each class inherits from
haviou	MonoBehaviour, inheriting members
r	and methods that should be used for most functionalities in the Scripts
gameOb	This Game Object (the Game Object
ject	to which the Script is attached)
tag	This Game Object's Tag
transf	This Game Object's Transform
orm	
GetCom	Returns the component of type Type
ponent	contained in this Game Object
<type< td=""><td></td></type<>	
>()	
GetCom	Returns all components of type Type
ponent	
s <ty< td=""><td></td></ty<>	
pe>()	
Destro	Removes something (after t
y(Obje	<pre>seconds). Destroy(gameObject) destroys</pre>
ct	the Game Object attached to the
obj,	Script. Destroy(this) destroys
float t =	the Script Component itself.
0 0f))	Destroy(GetComponent<>

API (cont)	
Instant iate(Ob ject origina 1)	Clones a GameObject or Component and returns the clone. If you clone a Component, the whole GameObject it is attached to will also be cloned
GameObjec	t
GameObj ect	Base class for all entities in Unity Scenes
tag	Tag of this Game Object
transfo rm	Transform of this Game Object
SetActi ve(bool <i>value</i>)	Activate/deactivate this Game Object
GameObj ect.Fin dWithTa- g(" <i>Tag</i> ")	Static method that finds and returns the first Game Object with tag <i>Tag</i>
Component	
Compone nt	Base class for everything attached to GameObjects. For every specifc component there is a class (with the same name as the Component), inheriting from this. Ex: Transform

Trans	form

position	Position as a Vector3
rotation	Rotation as a Quaternion

API (cont)	
Rotate(flo at xAngle, float yAngle, float zAngle)	Rotate around X, Y, Z axis
Translate(Vector3 <i>translatio</i> n)	Moves position. Ex: transform.Translate(Ve ctor3.forward*Time.de ltaTime)
Vector	
new Vector2(x ,y)	Create new 2D vector
new Vector3(x ,y,z)	Create new 3D vector. Transform's positions are always Vector3, even in 2D! (But you shouldn't set positions directly to move objects)
v + u,v - u	Sum/subtract two vectors
v * 5,v / 5	Multiply/divide a vector by a number
<i>target</i> .po sition - <i>player</i> .po sition	Vector representing the distance between the two objects's Transforms
v.magnitud e	Vector's length
v.normaliz ed	Vector with the same direction, but magnitude of 1
V.X	Access X component (same for Y and Z)
Debugging	
Debug.Log(*"message");	Prints a messaget to the Console
Rigidbody2D

API (cont)	
mass	The body's mass. You can access all the other properties that you see from the Inspector as well
AddForce (Vector2- force)	Apply a force to the Rigidbody. Use this inside ${\tt Update}()$ for a constantly applied force
AddTorqu e(float <i>torque</i>)	Add a torque (gives an angular acceleration)
MovePosi tion(Vec- tor2 position)	Quickly thrust towards a new position (tries to get there in the time of a physics update, but collisions or long distances may impair it). Use this in FixedUpdate() rather than in Update()
