Hardware

Definition: The physical parts of a computer that user interacts with directly

Function: *Provides the necessary technologies for:* 1)humans to input data, 2)computers to process the data and then finally 3)to output information in a way that humans can understand.

Modular design

Main Definition:	A computer consists of separate components and peripherals instead of one unit.
Other Definition:	The individual parts of computers are separate components rather than the entire system being one unchangeable unit.
Function:	To easily be able to modify/change/exchange and remove peripherals or components.
Commonly Found:	in desktops
Advantages:	
1)Easy to upgrade:	**Explanation:** Certain components can be added or replaced with better ones if needed.
2)Easy to repair:	**Explanation:** If a component breaks, just that component can be replaced.

Hardware used for Input
