### Java 8 Streams Cheat Sheet by carlmig via cheatography.com/67226/cs/16854/

Specializ	ed Streams		Apply a function to each element (cont)	
IntStream		for int elements	flatMap	similar to map, but the number of elements resulting may be different. It's normally used to convert a List of List into
DoubleStream		for double elements		
LongStream		for long elements		a single list with all the elements
It has better performance to use these specialized streams when using numeric data types, because there is no boxing/unboxing			реек	.peek (e -> e.sala ryI ncr eme nt ( 10.0)) will apply the give function to all elements in the list, but doesn't substitute the elements in the list
Suppress elements			Reduce e	elements to single value
limit . w	limit(5) vill limit the result to t skip(5)	he first 5 elements	reduce	.reduc e(0.0, Double ::sum) will return a single value. It starts with the identity value
w filter	<pre>will skip the first 5 elements ar .filter(e -&gt; e.getS alary() &gt; 200000)</pre>			the array. In this case it's summing all elements, one by one
W Ci	vill keep the elements that satisfy the given predicate. In this case, all elements that have salary above 200000		allMatch	.allMa tch(i -> i % 2 == 0); will check if all elements match the given condition. If so, returns true, else returns false
Comparing elements			anyMatch	.anyMa tch(i -> i % 2 == 0);
distinct	.disti nct() will compare the elements in the stream using equals() and elim		minate	will check if one of the elements match the given condition. If so, returns true, else returns false
	duplicates		noneMate	<pre>ch .noneM atch(i -&gt; i % 2 == 0);</pre>
sorted	<pre>.sorte d((e1, e2) -&gt; e1.get Nam e().co mpa reT N ame())) will sort the elements with the given comparator. Elements must able.</pre>		co(e 2.g	et will check if no elements match the given condition. If so, returns true, else returns false
			st b <del>ran Groinsip</del> a	<ul><li>arfindF irst()</li><li>will return an Optional with the first element in the</li></ul>
min	Similar to sorted, but it will find the min element according to the		ne given	stream
	comparator		forEach	forEach(e -> e.sala ryI ncr eme nt( 10.0
max	Similar to sorted, but it will find the max element according to comparator		he given	)) will apply the given function to each element in the stream, but it's a terminal operation and returns void
Apply a function to each element			count	.count()
map	.map(e m	pl oye eRe pos ito ry: :fi nd		outputs the number of elements in the stream

map.map (e mpl oye eRe pos ito ry: :find<br/>ById)<br/>will apply the given function and substitute the<br/>elements in the stream for new elements. In this<br/>case, it received a stream of employee IDs and<br/>returned a stream of Employee objectsmapToDouble<br/>mapToIntsimilar to *map*, but the function converts the<br/>element to the specified primitive type, resulting in<br/>a specialized stream IntStream, DoubleStream or<br/>LongStream

# Cheatography

## Java 8 Streams Cheat Sheet by carlmig via cheatography.com/67226/cs/16854/

Collect elements					
toList	collec t(C oll ect ors.to List()) gather all elements in the stream into a List				
toSet	collec t(C oll ect ors.to Set()) gather all elements in the stream into a Set				
toColl- ection	collec t(C oll ect ors.to Col lec tio n(V ect or: :new)) gather all elements in the list in an arbitrary Collection				
joining	<pre>collec t(C oll ect ors.jo ini ng( ", " )).t oS tring() will join String elements with the given separator and return the aggregated String</pre>				
summarizingDouble					
summaryStatistics					
partition- ingBy	<pre>.colle ct( Col lec tor s.p art iti oni ngBy(s -&gt; s.getG rade() &gt;= PASS_T - HRE SHOLD)) will partition the data into 2 categories based on the given condition. The result will be a Map<bo- list<student="" olean,="">&gt;</bo-></pre>				
groupingBy	.colle ct( Col lec tor s.g rou pin gBy (Em plo yee ::g etD epa rtm ent)); will group the elements into categories based on the function. The result will be a Map <depar- tment, List<employee>&gt;</employee></depar- 				
mapping	<pre>mappin g(P ers on: :ge tLa stName, toSet()) it receives a function to be applied to all elements and way of collecting downstream the elements. In this case, it will get the last name of all persons and add them to a set</pre>				
reducina
