

Function

print()	Show information that you want on the screen
int()	Change number to be number integer
float()	Change number to be decimal number
input()	Gain information from user
str()	A list of number, letter and symbols
len()	The length of the string
#	Comment, no effect

Vocabulary

Variable	Hold a value and can be change
String	A list of character such as number, letter and symbols
Integer number	Whole number/counting number
Float number	The number in decimal
Syntax	Grammar/Structure of language
Modulo	Find the remainder
Boolean	True/False

Example

Print (2) - integer
Print (2.5) - floating point
Print ("Hello") - string
Print (mystr) - variable
Print (mystr, "Hi", 2, 1.0) -- commas

Reverse

```
#Finish this program so that it
gets a word from the user and
prints
#that word backwards
reverse = "" #do not change
letter_num = 0 #do not change
word = input("Please enter a word:
")#get a word from the user
'''
while letter_num <
len(word):#compare the letter_num
to the lenght of the word
reverse =
word[letter_num]+reverse#kepp
adding the letter to the front of
reverse
letter_num = letter_num+1#go to the
next letter in the word
'''
for lette in word :
reverse = letter + revers
print ("Reverse: ",reverse)
#creating list

#write a function
#name : areaOfTriangle
#parameters : base height
#return : area
user_base = float(input('Enter the
base of the triangle: '))
user_height = float(input('Enter
the height of the triangle: '))
print ('The area of the triangle
is', )
```

Countdown

```
# Create a program that receives a
number from the user and counts
down
# from that number on the same line
# receive the number from the user
as a string
user_number = input("7")
#convert the user number to an
integer
number = int(user_number)
#setup the countdown string
countdown_string = '7 6 5 4 3 2 1
0'
while number > 0:
# add the number to the string
countdown_string = something +
str(somethingelse)
# subtract 1 from the number
number = number - 1
print (countdown_string)
```

Radius of Circle

```
while True:
#Ask the user for a radius of a
circle
user_radius = input("Please enter
the radius of the circle")
#Convert the given radiusto a
floating point
radius = float(user_radius)
#make a variable called pi
pi = 3.1415
#Calculate the area of the circle
using exponents
area = pi radius *2
#display the area of the circle to
the user
print("The area of the circle is",
area)
```

Random

```
import random

# Create a list of integers
