

Calculus II Cheat Sheet by CROSSANT (CROSSANT) via cheatography.com/186482/cs/38975/

Series				
Series Type	General Summation	Convergence	Divergence	Notes
Infinite Series	$\Sigma a_n = \Sigma^{\infty}_{n=k} a_n$	Converges if $\lim_{n\to\infty} S_n = L$	Diverges if lim $_{n->\infty} = \infty$ or DNE	S_n is the partial sum of the series: $S_n = a_1 + a_2 + a_3 + a_4 + + a_{n-1} + a_n$
Harmonic Series	Σ1/n	Never converges	Always diverges	The alternating version of this series $(\Sigma(-1)^{n+1}/n)$ converges, and $\Sigma 1/n$ is a P-Series with p=1
Geometric Series	$\Sigma^{\infty}_{n=0}$ ar ⁿ = $\Sigma^{\infty}_{n=1}$ ar ⁿ⁻¹	Converges if r <1	Diverges if r ≥1	If the series converges, its sum is S=a/(1-r)
P-Series	Σ1/n ^p	Converges if p>1	Diverges if p≤1	
Altern- ating Series	$\Sigma(-1)^{n}b_{n}$, $\Sigma(-1)^{n+1}b_{n}$, or $\Sigma(-1)^{n-1}b_{n}$	Converges if $\lim_{n\to\infty} =0$ and b_n is a decreasing sequence $(b_{n+1}\le b_n$ for all n)	Cannot show dive	ergence, inconclusive
Telesc- oping Series	$\Sigma(b_n \text{-} b_{n+1})$	Converges if lim _{n->∞} =L	Diverges if lim $_{n\to\infty} S_n = \infty$ or DNE	S_n is the partial sum of the series: $S_n = \Sigma^n_{i=1}(b_i - b_{i+n})$ where n is finite

Alternating Series Estimation Theorem: If $S_n = \Sigma^n_{i=1}(-1)^n b_n$ or $\Sigma^n_{i=1}(-1)^{n-1} b_n$ is the sum of an alternating series that converges, then $|R_n| = |S - S_n|$

Trigonometric functions like $cos(n\pi)$ or $sin(n\pi+\pi/2)$ act as sign alternators, like $(-1)^n$

The Alternating Series Test does not show divergence, however, implementing the test requires a Test For Divergence, which does show divergence

Series Tests				
Test Type	Typical series to use test	Convergence	Divergence	Notes
Test for Divergence	Σa _n	Cannot show convergence, inconclusive	Diverges if lim n-	->∞ ≠0

Calculus II Cheat Sheet by CROSSANT (CROSSANT) via cheatography.com/186482/cs/38975/

Series Tests (c	ont)			
Integral Test	Σa_n =f(n), which is a positive, continuous, decreasing function on the interval [k, ∞), usually with easily-integrable functions	Converges if $\int_{\mathbf{k}}^{\infty}$ f(n)dn converges	Diverges if $\int_{\mathbf{K}}^{\infty} f(\mathbf{n}) d\mathbf{n}$ diverg	ges
(Direct) Comparison Test	a_n and b_n are positive-termed ($a_n \ge 0$ and $b_n \ge 0$ for all n) and $a_n \le b_n$ for all n	Σa_n converges if Σb_n converges	Σb_n diverges if Σa_n diverges	Inconclusive if b _n diverges or a _n converges
Limit Comparison Test	a_n and b_n are positive-termed, and $\lim_{n\to\infty}a_n/b_n=c$, or $\lim_{n\to\infty}b_n/a_n=d$, where c and d are finite constants greater than 0	Σa_n converges \iff Σb_n converges	Σa_n diverges $\iff \Sigma b_n$ diverges	Inconclusive if either c or d=0 or $_{\infty}$
Ratio Test	Σa_n , usually with n! terms or $a_n^{\ n}$	Absolutely converges if $\lim_{n\to\infty} a_{n+1}/a_n < 1$	Diverges if lim n->∞ a _{n+1} /a _n >1	Inconclusive if lim $_{n->\infty} a_{n+1}/a_n =1$
Root Test	Σa _n , usually with a _n ⁿ	Absolutely converges if $\lim_{n\to\infty} a_n ^{1/n} < 1$	Diverges if $\lim_{n\to\infty}$ $ a_n ^{1/n} > 1$	Inconclusive if lim $_{n->\infty}\left a_{n}\right ^{1/n}=1$
Absolute/- Conditional Convergence	Σa _n	Absolutely converges if $\Sigma a_n $ converges	Conditionally converges if $\Sigma a_n \text{ diverges, but } \Sigma a_n$ converges	Diverges if Σa _n diverges

For the series listed, assume each series to be an infinite series starting at n=k: $\Sigma_{n=k}^{\circ}=\Sigma$

If Test for Divergence passes (lim $_{\text{N-}>_{\infty}}$ =0), use another test

The symbol [\iff] represents the relationship "if and only if" (often abbreviated to "iff"), meaning both sides of the statement must be true at the same time, or false at the same time

If a test is inconclusive, use another test

Special Series			
Series	Summation Form	First five terms	Radius and Interval of Convergence
Power Series centered at a	$\Sigma C_n(x-a)^n$	$C_0+C_1(x-a)+C_2(x-a)^2$	$+C_3(x-a)^3+C_4(x-a)^4+$

On wint Ordina (com)			
Special Series (cont)			
Taylor Series centered at a	$\Sigma f^{(n)}(a)(x-a)^n/n!$	$f(a)+f'(a)(x-a)+f''(a)(x-a)^{2}/2!+f'''(a)(x-a)^{3}/3!+f^{(4)}(a)(x-a)^{4}/4!+$	R> x-a
Maclaurin Series (Taylor Series centered at 0)	$\Sigma f^{(n)}(0)(x-0)^n/n! = \Sigma f^{(n)}(0)x^n/n!$	$f(0)+f'(0)x+f''(0)x^2/2!+f'''(0)x^3/3!+f^{(4)}(0)x^4/4!+$	
1/(1-x)	Σx^n	1+x+x ² +x ³ +x ⁴ +	R=1, I=(- 1,1)
e ^x	Σx ⁿ /n!	$1+x+x^2/2!+x^3/3!+x^4/4!+$	R=∞, I=(- ∞,∞)
ln(1+x)	Σ (-1) ⁿ⁺¹ x ⁿ /n	$x-x^2/2+x^3/3-x^4/4+x^5/5+$	R=1, I=(- 1,1]
arctan(x)	$\Sigma (-1)^n x^{2n+1} / (2n+1)$	$x-x^3/3+x^5/5-x^7/7+x^9/9+$	R=1, I=[- 1,1]
sin(x)	$\Sigma(-1)^n x^{2n+1}/(2n+1)!$	$x-x^3/3!+x^5/5!-x^7/7!+x^9/9!+$	R=∞, I=(- ∞,∞)
cos(x)	$\Sigma (-1)^n x^{2n} / (2n)!$	$1-x^2/2!+x^4/4!-x^6/6!+x^8/8!+$	R=∞, I=(- ∞,∞)
(1+x) ^k	$\Sigma(^{k}{}_{n})x^{n}=\Sigma((k(k-1)(k-2)(k-3)(k-n-1))/n!)x^{n}$	$1+kx+k(k-1)x^2/2!+k(k-1)(k-2)x^3/3!+k(k-1)(k-2)(k-3)x^4/4!+$	R=1
Taylor's Inequality	R _n (x) ≤M x-a ⁿ⁺¹ /(n+1)!, given M≥	⁽ⁿ⁺¹⁾ (x) for all x-a ≤d	

For the series listed, assume each series to be an infinite series starting at n=0: $\Sigma^{\circ}_{n=0}$ = Σ

Note that the formula for a Degree 1 Taylor Polynomial, $T_1(x)$, has the same formula as the Linear Approximation formula learned in Calculus I $f^{(n)}$ means "the nth derivative of the function f"

 $n! = n(n-1)! = n(n-1)(n-2)! = n(n-1)(n-2)(n-3)! = \dots$

n! = n(n-1)(n-2)(n-3)...*3*2*1

0!=1, 1!=1

Areas of Functions \int_{a}^{b} ((top function)-Between two (bottom function))dA functions $\frac{1}{2}\int_{a}^{b}f(\theta)^{2}d\theta$ Enclosed by a polar function ½∫a^b ((outer polar Between two polar function)2-(inner functions polar function)²)dθ Area enclosed by a polar function is with respect to the pole, which is the origin

Volumes of Solids of Revolution

Average value of a function:

 $f_{avq}=1/(b-a)\int_a^b f(x)dx$

Disk	$\pi \int_a^b (radius)^2 dV$
Washer	$\pi \int_a^b (\text{outer radius})^2 - (\text{inner radius})^2 dV$
Cylind- rical Shell	$2\pi \int_a^b (radius)(height)dV$
F 0 !!	

For Cylindrical Shells: radius=x or y, and height=f(x) or g(y)

Arc Lengths	
Function	∫a ^b √(1+
	$(f'(x))^2)dx$
Parametric	$\int_a{}^b\sqrt{((x'(t))^2}+$
Function	$(y'(t))^2)dt$
Polar	$\int_a^b \sqrt{(r(\theta)^2 + }$
Function	$(r'(\theta))^2)d\theta$

dy/dx
For parametric functions: x'(t)=dx/dt and y'(t)=dy/dt

For polar functions: $r'(\theta)=dr/d\theta$

For standard functions: f'(x)=-

Surface Areas	
Function revolved about an axis	$2\pi \int_{a}^{b}$ (radius)(Arc Length component)ds
Function revolved about y-axis	$2\pi \int_{a}^{b} x\sqrt{1+}$ $(f'(x))^{2})dx$
Function revolved about x-axis	$2\pi \int_a^b y\sqrt{(1+(g'(y))^2})dy$
Parametric function of t revolved about	$2\pi \int_{a}^{b} f(x)\sqrt{((x'(t))^{2}+}$ $(y'(t))^{2})dt$

f'(x)=dy/dx, g'(y)=dx/dy, x'(t)=-dx/dt, and y'(t)=dy/dt

2π∫a^b

 $g(y)\sqrt{((x'(t))^2+}$

 $(y'(t))^2)dt$

Integration by Parts

Parametric

function of t

x-axis

revolved about

Indefinite	∫udv=uv-∫vdu
Integral	
Definite	$\int_a^b udv = uv _a^b$ -
Integral	∫a ^b vdu

Integration by Parts is used to integrate integrals that have components multiplied together in their simplest form, often referred to as a "product rule for integrals"

Choosing the "dv" term depends on what will simplify the integral the best, while being relatively simple to integrate

The constant of integration does not need to be inserted until the integral has been fully simplified

Trigonometric Integrals

https://cheatography.com/crossant/cheat-sheets/integral-trigonometry/

Integration by Partial Fractions

(px+q)/((x-a) (x-b))	A/(x-a) + B/(x-b)
$(px+q)/(x-a)^2$	$A/(x-a) + B/(x-a)^2$
(px²+qx+r)/(- (x-a)(x-b)(x- c))	A/(x-a) + B/(x-b) + C/(x-c)
$(px^2+qx+r)/((x-a)^2(x-b))$	$A/(x-a) + B/(x-a)^2 + C/(x-b)$
$(px^2+qx+r)/((-x-a)$ $(x^2+bx+c))$	$A/(x-a) + Bx+C/(x^2+bx+c)$
$\int 1/(a^2 + x^2) dx$	(1/a)arctan(- x/a)+C

Integration by Partial Fractions is used to simplify integrals of polynomial rational expressions into simpler fractions with a factored, irreducible denominator

The degree (highest power) of the numerator's polynomial must be less than the degree of the denominator's polynomial, otherwise, polynomial long division must be used before converting the expression into partial fractions

Improper Integrals

f(x)dx $t\to\infty$ $\int_X^t f(x)dx$

∫∞a	$\lim_{t\to\infty}\int_a^t f(x)dx$
f(x)dx	
∫b∞	$\lim_{t\to -\infty} \int_t^b f(x) dx$
f(x)dx	
$\int_{-\infty}^{\infty}$	$\lim_{t\to-\infty}\int_t^c f(x)dx + \lim_{t\to\infty}\int_t^c f(x)dx$

Improper Integrals (cont)

Convergence	$\lim_{t\to\pm\infty} = L$
of ∫f(x)dx	
Divergence of	$\lim_{t\to\pm\infty}=\pm\infty$
∫f(x)dx	or DNE

Improper Integrals are integrals with bounds at infinity (Type 1) or discontinuous bounds (Type 2)

Conic Sections

https://cheatography.com/cross-ant/cheat-sheets/conic-sections/

Parametric Curves and Polar Functions

Parametric	(x,y)=(f(t),g(t))
Curve C as a	for t on [a,b]
function of	
Parameter t	
Slope at a	dy/dx=-
given point	(dy/dt)/(dx/dt)
Second	$d^2y/dx^2 = (dy/d -$
derivative	$t)/(dx/dt)^2$
Polar Curve C	$(r,\theta)=(r,\theta\pm2-$
as a function	πn)=(-r, $\theta \pm \pi n$)
of Parameter	
θ	
Slope at a	dy/dx=-
given point	$(dy/d\theta)/(dx/d\theta)$

given point $(dy/d\theta)/(dx/d\theta)$ Cartesian/Re- $x=rcos(\theta)$, ctangular to $y=rsin(\theta)$ Polar coordinates

Polar to $r^2=x^2+y^2$ or $r=\sqrt{(x^2+y^2)}$, ctangular $tan\theta=y/x$ or

 θ =arctan(y/x)

 $(dx/dt)\neq 0$, $(dx/d\theta)\neq 0$

coordinates

Integral Approximations and Error Bounds

Midpoint

 $\Delta x(f(\bar{x}_1) + f(\bar{x}_2) + f(\bar{x}_3) + ... + f(\bar{x}_{n-1}) + f(\bar{x}_n))$

Rule

Trapez- $(\Delta x/2)(f(x_1)+2f(x_2)+2f(x_3)+...+2f(x_{n-1})$

oidal Rule

 $_{1})+f(x_{1}))$

Simpson's

 $(\Delta x/3)$

Rule

 $(f(x_1)+4f(x_2)+2f(x_3)+4f(x_4)+2f(x_5))+...+$

 $2f(x_{n-2})+4f(x_{n-1})+f(x_n))$

Midpoint

 $|E_m| \le k(b-a)^3/24n^2$, $k=f''(x)_{max}$ on [a,b]

Rule Error

Bound

Trapez-

 $|E_t| \le k(b-a)^3/12n^2$, $k=f''(x)_{max}$ on [a,b]

oidal Rule

Error

Bound

Simpson's

 $|E_s| \le k(b-a)^5/180n^4$, $k=f^{(4)}(x)_{max}$ on

Rule Error

[a,b] Bound

Integral Approximations are typically used to evaluate an integral that is very difficult or impossible to integrate

 $\Delta x = (b-a)/n$

 $\bar{x}=(x_{i-1}+x_i)/2$, the average/median of two points x_{i-1} and x_i

Simpson's Rule can only be used if the given n is even, that is, n=2k for some integer k.

In order of most accurate to least accurate approximation: Simpson's Rule, Midpoint Rule, Trapezoidal Rule, Left/Right endpoint approximation
