

Numpy - Single dimensional arrays		Useful Numpy Functions		Combining Arrays	
Creating an array from a list	<code>x = np.array(['a', 'b', '9', '8'])</code>	Array Creation:	<code>arange, array, copy, empty, empty_like, eye, fromfile, fromfunction, identity, linspace, logspace, mgrid, ogrid, ones, ones_like, r_, zeros, zeros_like</code>	<code>np.vstack((a1, a2) =</code>	<code>np.concat</code>
Array Data Types	Consist of integers, floating-point numbers, or strings. Data type must be consistent. Numpy's record array gives mixed DTypes	Conversions	<code>ndarray.astype, atleast_1d, atleast_2d, atleast_3d, mat</code>	<code>np.hstack(a1,a2) =</code>	<code>np.concat</code>
Find the length on an array	<code>np.len(x)</code>	Manipulations:	<code>array_split, column_stack, concatenate, diagonal, dsplit, dstack, hsplit, hstack, ndarray.item, newaxis, ravel, repeat, reshape, resize, squeeze, swapaxes, take, transpose, vsplit, vstack</code>	<code>vsplit</code>	<code>splits alor</code>
Accessing elements from an array	<code>x[index_num] x[1]</code>	Questions:	<code>all, any, nonzero, where</code>	<code>hsplit</code>	<code>splits alor</code>
Assign elements from index	<code>x[1]=c</code>	Ordering:	<code>argmax, argmin, argsort, max, min, ptp, searchsorted, sort</code>	Universal Functions (ufuncts) Implement vectorization (operations applied to whole arrays instead of individual elements) in NumPy which is way faster than iterating over elements. <code>x = [1, 2, 3, 4] y = [4, 5, 6, 7] z = np.add(x, y)</code>	
Slicing <code>x[start:end]</code>	<code>print(x[1:2]) ['b', '9']</code>	Operations:	<code>choose, compress, cumprod, cumsum, inner, ndarray.fill, imag, prod, put, putmask, real, sum</code>	Check if a function is a ufunc: <code>arr1 = np.array([10, 20, 30, 40, 50, 60])</code> <code>np.subtract(arr1, arr2)</code>	
Slicing <code>x[start:end:step]</code>	<code>print(x[1:3:2]) ['b', '8']</code>	Basic Statistics:	<code>cov, mean, std, var</code>	<code>newarr = np.divide(arr1, arr2)</code>	
Modify a new version of an array without changing the original	<code>y = x.copy()</code>	Basic Linear Algebra:	<code>cross, dot, outer, linalg.svd, vdot</code>	<code>newarr = np.remainder(arr1, arr2)</code>	
Negative slices, single value <code>x[-Distance from end]</code>	<code>x[-2] b</code>				
Negative slices, reversal <code>x[start:end: -step]</code>	<code>x[3:0:-2] 8, b</code>				
Adding to an array	<code>x.append('7')</code>				
Saving to binary file	<code>np.save(open('data.npy', 'wb'), data)</code>				

Iterating

```
arr = np.array([[1, 2, 3], [4, 5, 6]])
```

```
for x in arr: print(x)                [1, 2, 3], [4, 5, 6]
```

```
for x in arr: for y in x: print(y)    123456
```

```
for x in np.nditer(arr):             123456
```

```
for x in np.nditer(arr, flags=['buffered'], op_dtypes=['S']): print(x)    b '1', b'2', b'3'
```

```
for x in np.nditer(arr[:, ::2]): print(x)    1, 3, 5, 7
```

Enumeration means mentioning sequence number of somethings one by one.

```
for idx, x in np.ndenumerate(arr): print(idx, x)
```

```
for idx, x in np.ndenumerate(arr):    0,) 1 (1,) 2 (2,) 3
```

```
print(idx, x) (
```

```
for idx, x in np.ndenumerate(arr): print(idx, x)    Result Size: 1425 x 1251 import numpy as np arr = np.array([[1, 2, 3, 4], [5, 6, 7, 8]]) for idx, x in np.ndenumerate(arr): print(idx, x)    (0, 0) 1 (0, 1) 2 (0, 2) 3 (0, 3) 4 (1, 0) 5 (1, 1) 6 (1, 2) 7 (1, 3) 8
```
