Command line

Cache Management	Example of use
Clear all caches:	php magento cache:clean
Clearing a single cache:	php magento cache:clean config
Flush all caches:	php magento cache:flush
Flushing a single cache:	php magento cache:flush config

Index Management	Example of use
Runs all available indexes:	php magento indexer:reindex

Cron	Example of use
Runs all cron jobs by schedule:	php magento cron:run

Help & Knowledge	Example of use
Display help/infos about a command	php magento help indexer:r-eindex
Lists all available CLI commands	php magento list

Developement & Production	Example of use
Set to the production mode to harden your setup	php magento deploy:mode:set-production
(exceptions are not displayed to the user, only logged to log files)	
Developer mode is less secure than Production mode	php magento deploy:mode:set-developer
provides verbose logging (errors displayed in browser) enhanced debuggingand disables static view file caching	

Recompile Store	Example of use
Recompile the Magento 2 codebase	php magento setup:di:compile

EVENTS.XML FILE

Custom events can be dispatched by simply passing the unique event name in the dispatch function. Your unique event name is referencing in events.xml file which observers will react to that event.

The observer xml element has the following properties

name (required)	The name of the observer for the event definition
instance (required)	The fully qualified class name of the observer
disabled	Determines whether this observer is active or not. Default value is false
shared	etermines the lifestyle of the class. Default is false

Example

```
<event name="my_module_event_before">
<observer name="m yOb ser ver Nam e"
r \My Obs erv er" />
</event>
```

DI.XML File

What case we use di.xml ?

Example for Preference

```
<pr efe rence for="Ma gen to \Cus tom er \Api \Ad dre ssR epo sit ory I
```

Above code, When someone asks you to instantiate a Magento\Customer\Api\AddressRepositor

Example for Arguments

```
<type name="M age nto \Cu sto mer \Mo del \Re sou rce Mod el \Gro up" s
c e\P rox y</ arg ume nt>      </a rgu men ts> </t ype>
```

DI.XML File (cont)

In the above code, We are sending object mess replacing the existing angel events.xml file wh

Example for Plugin

```
<type name="M age nto \Cu sto mer
er for the event definition /> </t ype>
```

In the above code, public function clean($obje

Example for Virtual Types

```
virtualType name="our VirtualTypeName" typ
```

Creating a virtual type is sort of like creating a

Design Patterns In Magento

Model View Controller Pattern (MVC)

Design pattern where business, presen-tation and coupling logic are separated

Front Controller Pattern

Makes sure that there is one and only one point of entry. All requests are investigated, routed to the designated controller and then processed accordingly to the specification

Factory Pattern

Responsible of factorizing (instantiating) classes.

Singleton Pattern

Checks the whether this class has already been instantiated before, this results in a shared instance.

Registry Pattern

Internal registry: a global scoped container for storing data

Prototype Pattern

It defines that instances of classes can retrieve a specific other class instance depending on its parent class (the prototype)

Object Pool Pattern

A box with objects so that they do not have to be allocated and destroyed over and over again.

Design Patterns In Magento (cont)

Iterator Pattern

The iterator pattern defines that there is a shared way to iterate over a container with objects.

Lazy Loading Pattern

Lazy loading ensures that loading data is delayed until the point when it is actually needed.

Service Locator Pattern

The service locator pattern abstracts away the retrieval of a certain service. This allows for changing the service without breaking anything.

Module Pattern

An implementation of the module pattern would make sure that each element can be removed or swapped.

Observer Pattern

By defining observers (or listeners), extra code can be hooked which will be called upon as the observed event fires.
