

### Basics

`App.Router.map(fn)`

allows you to add routes and resources to your app

`App.advanceReadiness()`

call this function when your app is ready to be initialized

`App.deferReadiness()`

delays initialization until advanceReadiness is called

`App.inject(type, property, injection)`

add a property onto every object of a specific type

`Ember.ArrayController.extend({})`

represents several objects

`Ember.Controller.extend({})`

grouping of specific, non object related functionality (e.g authentication or search)

`Ember.Object.create({})`

create an instance of an object

`Ember.Object.createWithMixins(mixins, {})`

create an instance of an object with mixins

`Ember.Object.destroy()`

set isDestroying to true and schedule removal of all bindings and observing for the end of run loop

`Ember.Object.get(keyName)`

return value of property by given name while respecting computed and observed properties

`Ember.Object.reopenClass({})`

add methods and properties to a class

`Ember.Object.set(keyName, value)`

set the value of property while respecting computed properties, unknown properties, property observers and chaining

`Ember.ObjectController.extend({})`

represents a single object

### Basics (cont)

`Ember.isNone(obj)`

Returns true if the passed value is null or undefined.

### Ember.Application.initializer

`after: 'someInitializer'`

name of the initializer to run before running this initializer

`name: 'preload'`

name for this initializer

`initialize: function(container, application)`

function to execute when an app is initializing

### Ember.Application

`Ember.Application.create():`

creates an instance that will be your app and your app's namespace

`LOG_ACTIVE_GENERATION: true`

activate logging of automatically generated routes and controllers

`LOG_STACKTRACE_ON_DEPRECATION: true`

activate logging of deprecated method or property usage

`LOG_TRANSITIONS: true`

activate basic logging of successful transitions

`LOG_TRANSITIONS_INTERNAL: true`

activate detailed logging of all routing steps

`LOG_VIEW_LOOKUPS: true`

activate logging of results of view and template searches by routes

`rootElement`

DOM element or jQuery-compatible selector string where your app will be rendered

`});`

### Ember.Route

`Ember.Route.extend: (mixins, {`

`beforeModel: function(transition)`

hook executed before resolving models (use for early redirection)

`activate: function`

hooked called when router enters route the first time

`afterModel: function(model, transition)`

hooked called after models are resolved (use for late redirect)

`deactivate: function`

hook executes when the router completely exits this route

`model: function(params)`

provides data to be used by the controller and the view

`renderTemplate: function(controller, model)`

hook to override default template rendered for this route

`serialize: function(model)`

converts model into parameters for the url

`setupController: function(controller, model)`

function that can be used to configure the controller

`actions`

object with properties

`actions: { willTransition: function(transition) }`

called whenever transition triggered on current route

`actions: { error }`

`});`

### Ember.View

**Ember.View.extend:** *(mixins, {*

**attributeBindings:** *['dataSize', 'href']*

array of View's property names used to calculate View's DOM element's attributes

**classNamesBindings:** *['isAvailable', 'color']*

array of View's property names used to calculate View's DOM element's class attribute

**classNames:** *['color', 'size']*

array or string of View's class attribute

**controller:** *Ember.Controller.create( {} )*

instance of descendants of the Ember.Controller

**defaultTemplate:** *Ember.Handlebars.compile('...')*

compiled Handlebars template used when the view doesn't have the template or templateName property specified

**eventManager:** *{}*

an object with properties named after events that this view handles and values are functions that process these events

**layout:** *Ember.Handlebars.compile('...')*

compiled Handlebars template that wraps the view

**tagName:** *'em'*

string HTML tag to be used for View's DOM element

**template:** *Ember.Handlebars.compile('...')*

compiled Handlebars template used to render this view

**templateName:** *'some-template'*

string name of the template to be used to render this view (used instead of template)

*});*

### Ember.Object

**Ember.Object.extend:** *(mixins, {*

**init:** *function()*

method called when an instance of this class is created

*});*
