

### Hoisting

```
//var declaration example
(function() {
  var foo = 1;
  console.log(foo + " " + bar);
  var bar = 2;
})();
// Alerts "1 undefined" instead of throwing an error.
// It's aware of bar b/c the declaration was hoisted to
top of function.
// So no error, but the value is undefined until after
the alert.
//function example
foo();
function foo() {
  alert("Hello!");
}
// Same as above, the function declaration is hoisted
above the call();
```

Hoisting is JavaScript's default behavior of moving all var and function declarations to the top of the current scope (to the top of the current script or the current function).

### Functions

```
// Arrow Function
setTimeout(() => { console.log('delayed') }, 1000)
// Scoped Functions
{
  let cue = 'Luke, I am your father'
  console.log(cue)
}
>'Luke, I am your father'
// Scoped Function Equivalent with Immediately Invoked
Function Expressions (IIFE)
(function () {
  var cue = 'Luke, I am your father'
  console.log(cue) // 'Luke, I am -
})();
console.log(cue) // Reference Error
// Default Params!!
function test(num = 1) { console.log(num) }
```

### Promises

```
// Promise itself has three states: Pending, Fulfilled
, Rejected
let example = new Promise((resolve, reject) => {
  request.get(url, (error, response, body) => {
    if (body) {
      resolve(JSON.parse(body)); // fulfilled
    } else {
      let reason = new Error('There wan an error');
      reject(reason); // reject
    }
  })
}).then((val) => console.log("fulfilled:", val))
.catch((err) => console.log("rejected:", err));

// Run multiple promises in parallel
Promise.all([
  promise1, promise2, promise3
]).then(() => {
  // all tasks are finished
})
```

If you want to use Promises for recurring values or events, there is a better mechanism/pattern for this scenario called streams.

### Let vs Var

let variables are limited in scope to the block, statement, or expression on which it is used	var defines variables globally, or locally to an entire function regardless of block scope
---	--

Variables declared with let or const do not get hoisted	variables defined with var DO get hoisted
---	---

Can NOT be re-declared.	CAN be re-declared.
let a = 5;	var a = 5;
let a =6; // SyntaxError: redeclaration	var a = 6; // no error. a=6

let is more performant, and better for Garbage Collection

Support: Severside=Everywhere.	Universal support
Browsers IE11+ Android 56+ (altho you can use Babel transpiler)	

Hoisting is a bit of a quirk in JS. let behaves more like variable declarations in most other langs  
Douglas Crockford advises to always use let.

### Maps and Sets

#### What are Maps?

Basically a Object/hash with some advantages.

#### Difference between Maps and Objects:

An Object has a prototype, so there are default keys in the map  
 Maps preserve K-V in order they were added -- allows for iteration  
 Keys in Objects are treated like Strings Object.keys(myHash) returns a bunch of strings. They can be anything in a Map.

#### What is a WeakMap?

A Map where the keys are weak. Meaning if a key is deleted the value will be GC'd

#### What is a Set?

Highly performant array that preserves order of insertion, but does not index.

### Other New Features

Template Literals	My dog is \${age} years old
Default Params	function( greeting='Howdy' ){ console.log(greeting) }
Object literals	myHash = {color, size} // same as {color: color, size: size}
Spread Operator	[1, 2, ...more] or list.push(...[3, 4]) or new Date(...[2015,8,1])
Generator Function(*)	function *foo() {} //These can be paused & resumed later????
const variable type	Block scoped, immutable reference (vals in arrays can change)
Symbol variable type	Immuteable (Unclear advantage of these over hash obj)

### Classes, Inheritance, Setters, Getters

```
class Rectangle extends Shape {
  constructor(id, x, y, w, h) {
    super(id, x, y)
    this.width = w
    this.height = h
  }
  // Getter and setter
  set width(w) {
    this._width = w
  }
  get width() {
```

### Classes, Inheritance, Setters, Getters (cont)

```
    return this._width
  }
}

class Circle extends Shape {
  constructor(id, x, y, radius) {
    super(id, x, y)
    this.radius = radius
  }
  do_a(x) {
    let a = 12;
    super.do_a(x + a);
  }
  static do_b() { ...
  }
}

Circle.do_b()
```

### Spread Operator and Destructuring

```
> const [ cat, dog, ...fish ] = ['schroedinger',
'Laika', 'Nemo', 'Dori']
> fish // -> ['Nemo', 'Dori']
> cat // -> ['schroedinger']
> let arr = [1, 2, 3]
> [...arr, 4, 5, 6]
> [1, 2, 3, 4, 5, 6]
```
