## AP Stats Chapter 10 Cheat Sheet <br> by GSarkar via cheatography.com/76104/cs/18822/

| Two Proportion Confidence Interval |  |
| :---: | :---: |
| Shape | When the large counts rule is met, the sampling distribution of $p^{1}-p^{2}$ is approximately normal |
| Center | The mean of the sampling distribution is $p^{1}-p^{2}$ |
| Spread | The standard deviation of the sampling distribution of $p^{1-}$ $p^{2}$ is the square root of the sum of $\left(p^{1}\right)\left(1-p^{1}\right)$ divided by $n^{1}$ and $\left(p^{2}\right)\left(1-p^{2}\right)$ divided by $n^{2}$ as long as each sample is no more than $10 \%$ of its population. |
| Conditions | Random (both samples must be random), 10\% (both samples less than $10 \%$ of respective population), Large Counts (for both samples individually) |
| Calculator | 2-PropZInterval |
| Interpretatio <br> n | We are $\qquad$ \% confident that the interval from $\qquad$ to $\qquad$ captures the true difference of $\left[p^{1}\right]$ and $\left[p^{2}\right]$ |
| Point <br> Estimate <br> Formula | $p^{1}-p^{2}$ |
| Critical Value Formula (Z*) | invNorm( $\quad$ \%/2 + 0.5) |
| Standard <br> Deviation <br> Formula | the square root of the sum of $\left(p^{1}\right)\left(1-p^{1}\right)$ divided by $n^{1}$ and $\left(p^{2}\right)\left(1-p^{2}\right)$ divided by $\mathrm{n}^{2}$ |
| Confidence <br> Interval <br> Formula | Point Estimate +/- Critical Value * Standard Deviation |

| Two Proportion Significance Test |  |
| :--- | :--- |
| Null Hypothesis | $p^{1}-p^{2}=$ Hypothesized Value |
| Alternative <br> Hypothesis | $p^{1}-p^{2}=$ Hypothesized Value |
| Conditions | Random (both), 10\% (both), Large Counts (both) |
| Pooled Sample <br> Proportion | $x^{1}+x^{2} / n^{11}+n^{2}$ (successes / size) |
| Statistic | $p^{1}-p^{2}$ |
| Parameter | Hypothesized Value (often 0) |
| Standard <br> Deviation | The square root of the sum of (pc)(1-pc) divided by $n^{11}$ <br> and $\left(p^{c}\right)\left(1-p^{c}\right)$ divided by $n^{2}$ |
| Test Statistic <br> Formula | Statistic - Parameter / Standard Deviation |

| Two Proportion Significance Test (cont) |  |
| :--- | :--- |
| Calculator | 2PropZTest |
| Areas of Error | Not a random sample = can't generalize results, <br> cause and effect vs correlation |
| IMPORTANT | If experimental units are randomly selected, check <br> the 10\%, otherwise technically not necessary |
| Ideal for <br> Conclusions about <br> Populations | Data from Two Independent Random Samples |

| Two Mean Confidence Interval |  |
| :---: | :---: |
| Shape | When the population distributions are normal, the sampling distribution of $x^{1}-x^{2}$ is approximately normal. Also normal, if both sample sizes are greater than 30 by CLT |
| Center | $\mu^{1}-\mu^{2}$ |
| Spread | If both samples are less than $10 \%$ of respective populations, the formula for standard deviation is the square root of the sum of $\sigma 1^{2} / n^{1}$ and $\sigma 2^{2} / n^{2}$ |
| Conditions | Random (both samples are independent and random or from two groups in a randomized experiment), 10\% (both), and Normal/Large (population distributions are normal or sample size greater than 30) |
| Calculator | 2SampTInt |
| Interpretatio <br> n of a <br> Confidence <br> Level | If we take many samples of size _ of _ and of _ of _ and find the __\% confidence interval for each sample, __\% of the confidence intervals will capture the difference in the mean number of $\qquad$ . |
| Interpretatio <br> n of <br> Confidence Interval | We are $\qquad$ \% confident that the interval from $\qquad$ to $\qquad$ captures the true difference in the $\qquad$ |

| Two Mean Confidence Interval (cont) |  |
| :---: | :---: |
| State | We want to estimate $\mu^{1}-\mu^{2}$ at the $\qquad$ \% confidence level where $\mu^{1}$ is $\qquad$ and $\mu^{2}$ is $\qquad$ |
| Point Estimate Formula | $\mathrm{x}^{1}-\mathrm{x}^{2}$ |
| Critical Value Formula ( $\mathrm{t}^{\star}$ ) | $\operatorname{invT}(\mathrm{p} / 2+0.5$, smaller n df) |
| Standard <br> Deviation/Error <br> Formula | The square root of the sum of $\sigma 1^{2} / \mathrm{n}^{1}$ and $\sigma 2^{2} / \mathrm{n}^{2}$ |
| Confidence Interval Formula | Point Estimate +/- Critical Value * Standard Deviation |

| Two Mean Significance Test |  |  |
| :---: | :---: | :---: |
| Null <br> Hypothesis | $\mu^{1}-\mu^{2}=$ Hypothesized Value |  |
| Alternative <br> Hypothesis | $\mu^{1}-\mu^{2}=$ Hypothesized Value |  |
| Conditions | Random (both), 10\% (both), Normal/Large (both)(no strong skew, outliers, or greater than 30) |  |
| Statistic | $\mathrm{x}^{1}-\mathrm{x}^{2}$ |  |
| Parameter | $\mu^{1}-\mu^{2}$ |  |
| Standard <br> Deviation | The square root of the sum of $s 1^{2} / n^{1}$ and $s 2^{2} / n^{2}$ |  |
| Test <br> Statistic <br> Formula <br> (T) | Statistic - Parameter / Standard Deviation |  |
| Calculator | 2SampTTest |  |
| Interpretati on of p value | Assuming the null hypothesis is true, there is a $\qquad$ probability of getting a difference in $\qquad$ just by the chance involved in random assignment/variability |  |
| Paired Data vs Two Samples |  |  |
| Paired Data |  | Two Samples |
| Subjects were paired and the split at random into the two treatment groups or each subject received both treatments in a random order |  | Experimental groups were formed using randomized design or two independent random samples were taken from the population |
