

Pathophysiolo	ogy
Gout	Inflammatory condition.
What makes Gout painful?	Build up of uric acid crystals in the joints, bones, or soft tissues. Usually affects one joint at a time and is most often the metatarsal phalangeal joint (MPJ)
What in the blood can lead to Gout?	Elevated uric acid levels
Hyperu- ricemia for males is what level?	>7 mg/dL
Hyperu- ricemia for	>6 mg/dL
Hyperuricemia does <i>not</i> always lead to	does not always lead to gout
At 37 degrees C, serum urate concentra- tions >7 mg/dL begin to limit	solubility for monosodium urate.
Higher concentrations of serum urate will lead to more what?	monosodium urate crystals (MSU)
Gout is more prevalent societies with	Lifestyles of overindulgence

Pathophysiolog	gy (cont)
Uric acid is the <i>final</i> step in the degradation of	Purines
The two common abnormalitites in enzymes that lead to increased uric acid	- Increased levels of PRPP (Phsphoribosyl pyroph- osphate synthetase) -Defic- iency of HGPRT (HYPOx- anthine-guanine phosphori- bosyltransferase)
Tophi is created by	Uric acid binding to sodium and creating monosodium urate (msu) crystals that get deposited in tissues/joints
Tophi is	the build up of uric acid crystals in the synovial fluid
Non-Modifiable Risk factors of Gout	Age, Sex, Race, Genetic Variants
Modifiable Risk Factors of Gout	Obesity, HTN, CKD, Diabetes, Medications altering urate balance
Medications that alter urate balance:	Diuretics, Ethanol, Salicy- lates (<2g/day), Nicotinic Acid, Pyrazinamide, Cyclosporin

0 10 -1	
Gout Prophylaxis	
First line for Gout Prophy- laxis	NSAIDs, Colchicine
Colchicine	0.6 mg PO daily or BID (QD>BID)
NSAID	Naproxen is an example (250 mg PO BID). May use a PPI if NSAID prolonged or increased GI bleeding risk.
Alternative/- First line contraind- icated Prophylaxis dosing	Low dose corticosteroids (like prednisone 10 mg/day)
Duration of Propphylaxis without tophi	3-6 months
Duration of Prophylaxis with >1 tophi or radiog- raphic evidence	6-12 months
Uricosuric	
2nd line Therapy for Gout Management	/ Probenecid
Rarely used monotherapy	but can be XOI is contraindicated or

Probenecid initial

dosing

Probenecid

maintenance dosing

ineffective

week

250 mg PO BID x1

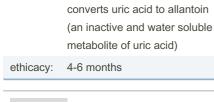

500 mg PO BID

Uricosuric (cont)		
Mainly for patients that	underexcrete uric acid	
MOA	Competitively inhibits the reabsorption of uric acid at the proximal convoluted tubule, thereby promoting its excretion and reducing serum uric acid levels	
Works where?	RENALLY	
Contraind- icated	Nephrolithiasis, moderate severe renal impairment (CKD 3)	
Effect of Salicylates on Probenecid	may impact the concentrations	

Recombinant U	ncase (cont)
MONOTH- ERAPY	Can only be used as monotherapy
Used for	Refractory gout when failed conventional therapies.
Produced from modified strain of	E. coli (Escherichia coli)
Start prophy- lactic therapy	1 week PRIOR to initiation (high risk of flares)
Duration of prophylaxis while on Pegloticas	6 months
Requires	Pre-treatment with antihistamines and corticosteroids to mitigate infusion reaction
Immunogen- icity	develops antibodies against itself
Discontinue therapy:	serum urate >6 mg/dL on more than one clinic visi
Contraind-icated:	G6PD-deficiency
G6PD-defi- ciency	Increase risk of Hemolysis and methemoglobinemia

Diagnosis, Signs, Symptoms, Classification		
Diagnosis of Gout	Symptoms are used for diagnosis	
Signs and Symptoms of Gout	Intense pain, <i>Erythema</i> , warmth, Fever, Tophi, Inflammation of Joint	
Where can inflammation of the joint be in Gout?	Toes, Knees, Fingers, Elbows, Ankles	
Uric Acid Levels	High uric acid levels do NOT always mean Gout!	
Leukoc- ytosis in Gout	MSU crystals induce inflam- mation and can INCREASE white blood cell count	
Diagnostic Testing for Gout	Arthrocentesis and Radiog- raphy	
Arthro- centsis	Removal of synovial fluid from the affected joint, microscopic examination, can give a definitive diagnosis of gout.	

Peglot-

icase MOA

Diagnosis, Signs, Symptoms, Classification (cont)			
Radiog- raphy	X-ray that can be used for more advanced gout, will be *unremarkable for first acute gout attacks, can help rule out other causes of arthritis.		
Conditions that precipitate Gout Attack	Most can't identify a <i>trigger</i> . Dehydration, Stress, excessive alcohol intake, excessive intake of purine-rich foods, increased physical activity, uric acid lowering agents, medications that increase uric acid levels		
What are the 4 Gout Classific- ations	Asymptomatic, Acute Gouty Arthritis, Intercritical Gout, Chronic recurrent Gout		
Asympt- omatic	Hyperuricemia		
Interc-	Intervals between attacks		

Diagnosis, Signs, Syn (cont)	nptoms, Classification
Severity of Chronic Tophaceous Gouty Arthritis (CTGA)	Mild, Moderate, Severe
CTGA Mild	One joint, <i>stable</i> disease
CTGA Moderate	2-4 joints, <i>stable</i> disease
CTGA Severe	4+ OR Unstable, complicated, severe articular tophi
Large Joints:	Knee, ankle, wrist, elbow, hip, shoulder
Medium Joints:	Ankle, Wrist, Elbow
Small Joints:	Interphalangeal

Large Joints: Knee, ankle, wrist, elbow, hip, shoulder Medium Joints: Ankle, Wrist, Elbow Small Joints: Interphalangeal Xanthine Oxidase Inhibitors (XOI) What are the Allopurinol, Febuxostat Two XOI for Gout? Allopurinol Initial dose Allopurinol 100-800 mg daily Maintenance (average is 300 mg/day) Allopurinol Renal adjustment stage 4+ Febuxostat initial dose Febuxostat Maintenance dosing Febuxostat Maintenance dosing		severe articular tophi
Small Joints: Interphalangeal Xanthine Oxidase Inhibitors (XOI) What are the Allopurinol, Febuxostat Two XOI for Gout? Allopurinol Initial dose Allopurinol 100-800 mg daily Maintenance (average is 300 mg/day) Allopurinol Renal adjustment 50 mg/day for CKD stage 4+ Febuxostat initial dose Febuxostat 40 mg PO daily Maintenance	Large Joints:	elbow, hip,
Xanthine Oxidase Inhibitors (XOI) What are the Allopurinol, Febuxostat Two XOI for Gout? Allopurinol Initial dose Allopurinol 100-800 mg daily Maintenance (average is 300 mg/day) Allopurinol Renal adjustment stage 4+ Febuxostat initial dose Febuxostat Maintenance 40-80 mg daily Maintenance	Medium Joints:	Ankle, Wrist, Elbow
What are the Two XOI for Gout? Allopurinol Initial dose Allopurinol 100-800 mg daily Maintenance (average is 300 mg/day) Allopurinol Renal adjustment stage 4+ Febuxostat initial dose Febuxostat 40-80 mg daily Maintenance	Small Joints:	Interphalangeal
Two XOI for Gout? Allopurinol Initial dose Allopurinol 100-800 mg daily Maintenance (average is 300 mg/day) Allopurinol Renal 50 mg/day for CKD adjustment stage 4+ Febuxostat initial dose Febuxostat 40-80 mg daily Maintenance	Xanthine Oxidase I	nhibitors (XOI)
Allopurinol 100-800 mg daily Maintenance (average is 300 dosing mg/day) Allopurinol Renal 50 mg/day for CKD adjustment stage 4+ Febuxostat initial 40 mg PO daily dose Febuxostat 40-80 mg daily Maintenance	Two XOI for	Allopurinol, Febuxostat
Maintenance (average is 300 dosing mg/day) Allopurinol Renal 50 mg/day for CKD adjustment stage 4+ Febuxostat initial dose Febuxostat 40-80 mg daily Maintenance	•	100 mg PO daily
adjustment stage 4+ Febuxostat initial 40 mg PO daily dose Febuxostat 40-80 mg daily Maintenance	Maintenance	(average is 300
dose Febuxostat 40-80 mg daily Maintenance	·	•
Maintenance		40 mg PO daily
	Maintenance	40-80 mg daily

Xanthine (Oxidase Inhibitors (XOI) (cont)
First line agent for	Chronic management of gout
Contra- indica- tions	CVD history or recent CV event
Genotype contra-indication	HLC-B*5801 haplotype
Genotype is conditionally recommended for what race?	Southeast Asian descent, African Americans
XOI MOA	Inhibits xanthine oxidase, an enzyme responsible for the conversion of hypoxanthine to xanthine to development of uric acid. Acts on purine metabolism, thereby reducing uric acid production without disrupting biosynthesis of vital purines
Black Box Warning	Febuxostat
Gout Mana	agement
Non-	Dietary Modifications, Promote

Gout Management (cont)		
Colchicine MOA	Decreases inflammation during gout flare by decreasing activation, degran- ulation and migration of neutrophils through inhibiting betatubulin polymerization into microtubules	
Colchicine is Contra- indicated when:	Blood dyscrasias, severe renal disease (CrCl <10 ml/min)	
If gout is seen on an x-ray, it's immedi- ately classified as	Severe	
Initiate Monoth- erapy	Mild/Moderate Pain intensity	
Initiate Combination Therapy	Severe, X-ray	
Combination therapy includes	Colchicine + NSAID, Colchicine + Oral Corticost- eroid, NSAID + IA injection, Colchicine + IA, Oral Cortic- osteroid + IA	
Goal Serum Urate level to maintain	<6 mg/dL	

Gout Management (cont)	
When using a ULT, what should also be used?	Anti-inflammatory to overlap
High level of evidence/- Strong recommend- ation for Initiation of ULT	1 or more subcutaneous tophi, evidence of radiog- raphic damage from gout, >2 gout flares per year
Moderate Evidence, Conditional recommend- ation	ULT is recommended for patients who have previously experienced >1 flare but have infrequent flares (<2 per year)
ULT options for Gout	Xanthine Oxidase Inhibitors (XOI), Recomb- inant Uricase, Probenecid
Fenofibrate	Increase clearance of hypoxanthine and xanthine. Consider if concomitant Hypertriglyc- eridemia
Losartan	Inhibits tubular reabso- rption of uric acid and increases excretion. Alkalinizes urine to reduce risk of calculi
