# Data Mining Cheat Sheet by HockeyPlay21 via cheatography.com/36862/cs/11602/

Data Mining Steps	
1. Data Cleaning	Removal of noise and inconsistent records
2. Data Integration	Combing multiple sources
3. Data Selection	Only data relevant for the task are retrieved from the database
4. Data Transformation	Converting data into a form more appropriate for mining
5. Data Mining	Application of intelligent methods to extract data patterns
6. Model Evaluation	Identification of truly interesting patterns representing knowledge
7. Knowledge Presentation	Visualization or other knowledge presentation techniques
Data mining could also	be called Knowledge Discovery in Databases (see

Data mining could also be called Knowledge Discovery in Databases (see kdnuggets.com)

ypes	of	Attri	bu	tes

Nomial	e.g., ID numbers, eye color, zip codes
Ordinal	e.g., rankings, grades, height
Interval	e.g., calendar dates, temperatures
Ratio	e.g., length, time, counts

**Distance Measures** 

# Euclidean Distance:

$$dist = \sqrt{\sum_{k=1}^{n} (p_k - q_k)^2}$$

# Minkowski Distance:

$$dist = \left(\sum_{k=1}^{n} p_k - q_k \right)^{\frac{1}{r}}$$

r=1, City Block r=2, Euclidean r–>inf., Chebyshev

Manhattan = City Block

Jaccard coefficient, Hamming, Cosine are a similarity / dissimilarity measures

Cheatography

# Model Evaluation

	PRE	DICTED CL	ASS
		Class=Yes	Class=No
ACTUAL	Class=Yes	a (TP)	b (FN)
CLASS	Class=No	c (FP)	d (TN)
Accuracy	$= \frac{TP}{TP+FN}$	+TN +TN+FP	
$Precision = \frac{TP}{TP + FP}$			
$\text{Recall} = \frac{TP}{TP + FN}$			
$F\text{-measure} = \frac{2 TP}{2 TP + FN + FP}$			
$Cost = TP \times Cost_{TP} + FN \times Cost_{FN}$			
$+TN \times Cost_{TN} + FP \times Cost_{FP}$			
Sensitivity = Recall			
Specificity = $1 - \frac{FP}{FP+TN} = \frac{TN}{TN+FP}$			
False Positive Rate = $1$ - Specificity			

Kappa = (observed agreement - chance agreement) / (1- chance agreement)

Kappa = (Dreal - Drandom) / (Dperfect - Drandom), where D indicates the sum of values in diagonal of the confusion matrix

## K-Nearest Neighbor

- \* Compute distance between two points
- \* Determine the class from nearest neighbor list
  - \* Take the majority vote of class labels among the k-nearest neighbors
  - \* Weigh the vote according to distance

K-Nearest Neighbor (cont)		Bayesian Classification	
* weight factor, w = 1 / d^2		(	Conditional Probability: $P(C \mid A) = \frac{P(A, C)}{P(A)}$
Rule-based Classification			$P(A \mid C) = \frac{P(A, C)}{P(C)}$
Classify records by using a collection of "ifthen" rules			Baye's theorem: $P(C \mid A) = \frac{P(A \mid C)P(C)}{P(A)}$
Rule: (Condition)> y where:			$posterior = \frac{likelihood \times prior}{normalizing constant}$
* Condition is a conjunction of attributes			Naïve Bayes Classifer:
* y is the class label LHS: rule antecedent or condition			$\text{Original}: P(A_t   C) = \frac{N_{to}}{N_c}$
RHS: rule consequent			Laplace: $P(A_r   C) = \frac{N_{te} + 1}{N_{e} + c}$
Examples of classification rules:		m - estimate : $P(A_t   C) = \frac{N_{te} + mp}{N_e + m}$	
(Blood Type=Warm) ^ (Lay Eggs=Yes)> Birds			c: number of classes, p: prior probability, m: parameter
(Taxable Income < 50K) ^ (Refund=Yes)> Evade=No Sequential covering is a rule-based classifier.		P(B A), read as the probability of <b>B</b> given <b>A</b> .	
Rule Evaluation			$P(B A) = \frac{P(A \text{ and } B)}{P(A)} P(A \text{ and } B) = P(A) \cdot P(B A)$
Accuracy = $\frac{n_c}{n}$		p(a,b) is the pro	bability that both a and b happen.
Laplace = $\frac{n_e + 1}{n + k}$ M-estimate = $\frac{n_e + kp}{n + k}$		p(a b) is the pro happened.	bability that a happens, knowing that b has already
n : Number of instances covered by rule n <sub>c</sub> : Number of instances of class <i>c</i> covered b <i>k</i> : Number of classes p : Prior probability (for the positive class)	y rule	Terms	
		Association Analysis	Min-Apriori, LIFT, Simpson's Paradox, Anti- monotone property
		Ensemble Methods	Staking, Random Forest

# Terms (cont)

Decision Trees	C4.5, Pessimistic estimate, Occam's Razor, Hunt's Algorithm
Model Evaluation	Cross-validation, Bootstrap, Leave-one out (C-V), Misclassification error rate, Repeated holdout, Stratification
Bayes	Probabilistic classifier
Data Visualization	Chernoff faces, Data cube, Percentile plots, Parallel coordinates
Nonlinear Dimensionality Reduction	Principal components, ISOMAP, Multidimensional scaling

### Ensemble Techniques

# AdaBoost Algorithm:

$$\alpha_t = \frac{1}{2} \ln \left( \frac{1 - \epsilon_t}{\epsilon_t} \right)$$

error ( $\epsilon_t$ ) = # of misclassified divided by total  $w_i = w_1 = w_2 = \dots = w_{10} = \frac{1}{10} = 0.1$  *Re-weighting: misclassified* =  $w_i \times e^{+\alpha_t}$ *correct classified* =  $w_i \times e^{-\alpha_t}$ 

Manipulate training data: bagging and boosting ensemble of "experts", each specializing on different portions of the instance space

Manipulate output values: error-correcting output coding (ensemble of "experts", each predicting 1 bit of the {multibit} full class label)

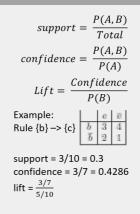

# Methods: BAGGing, Boosting, AdaBoost

# ales Analysis

# Apriori Algorithm

Let k=1
Generate frequent itemsets of length 1
Repeat until no new frequent itemsets are identified
Generate length (k+1) candidate itemsets from
length k frequent itemsets
Prune candidate itemsets containing subsets
of length k that are infrequent
Count the support of each candidate by
scanning the DB
Eliminate candidates that are infrequent,
leaving only those that are frequent

## K-means Clustering

Select K points as the initial centroids

#### repeat

Form K Clusters by assigning all points to the closest centroid

- Recompute the centroid of each cluster
- until the centroids don't change

**Closeness** is measured by distance (e.g., Euclidean), similarity (e.g., Cosine), correlation.

Centroid is typically the mean of the points in the cluster

# **Hierarchical Clustering**

#### Single-Link or MIN

Similarity of two clusters is based on the two most similar (closest / minimum) points in the different clusters

Determined by one pair of points, i.e., by one link in the proximity graph. Complete or MAX

Similarity of two clusters is based on the two least similar (most distant, maximum) points in the different clusters

Determined by all pairs of points in the two clusters

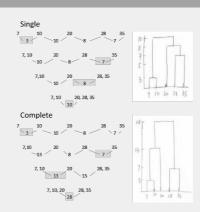

#### **Group Average**

Proximity of two clusters is the average of pairwise proximity between points in the two clusters

**Agglomerative** clustering starts with points as individual clusters and merges closest clusters until only one cluster left.

**Divisive** clustering starts with one, all-inclusive cluster and splits a cluster until each cluster only has one point.

## Dendrogram Example

#### Dataset: {7, 10, 20, 28, 35}

## **Density-Based Clustering**

current\_cluster\_label <-- 1

for all core points do

- if the core point has no cluster label then
   current\_cluster\_label <--</pre>
- current\_cluster\_label +1

Label the current core point with the cluster label

#### end if

for all points in the Eps-neighborhood, except i- th the point itself  $\ensuremath{do}$ 

if the point does not have a cluster label
m

then

Label the point with cluster label

# end if

end for

Density-Based Clustering (cont)

end for

DBSCAN is a popular algorithm

Density = number of points within a specified radius (Eps)

A point is a core point if it has more than a specified number of points (MinPts) within Eps

These are points that are at the interior of a cluster

A border point has fewer than MinPts within Eps, but is in the neighborhood of a core point

A noise point is any point that is not a core point or a border point

## Other Clustering Methods

**Fuzzy** is a partitional clustering method. **Fuzzy clustering** (also referred to as **soft clustering**) is a form of clustering in that each data point can belong to more than one cluster.

**Graph-based** methods: Jarvis-Patrick, Shared-Near Neighbor (SNN, Density), Chameleon

Model-based methods: Expectation-Maximization

# **Regression Analysis**

- \* Linear Regression
- | Least squares
- \* Subset selection
- \* Stepwise selection
- \* Regularized regression
- | Ridge
- | Lasso

## Regression Analysis (cont)

| Elastic Net

#### Anomaly Detection

Anomaly is a pattern in the data that does not conform to the expected behavior (e.g., outliers, exceptions, peculiarities, surprise)

#### **Types of Anomaly**

*Point:* An individual data instance is anomalous w.r.t. the data *Contextual:* An individual data instance is anomalous within a context *Collective:* A collection of related data instances is anomalous

### Approaches

- \* Graphical (e.g., boxplots, scatter plots)
- \* Statistical (e.g., normal distribution, likelihood) | Parametric Techniques

| Non-parametric Techniques

\* Distance (e.g., nearest-neighbor, density, clustering)

Local outlier factor (LOF) is a density-based distance approach

Mahalanobis Distance is a clustering-based distance approach
