

ssh

<code>sshfs [USER@HOST]: [remote directory] mountpoint [options]</code>	mount remote drive in mountpoint
<code>ssh -o ServerAliveInterval=X -o ServerAliveCountMax=Y [HOST]</code>	Maintaining ssh connection for X seconds and Y tries
<code>ssh-copy-id -i ~/.ssh/id_rsa [USER@HOST]</code>	add authentication via ssh, not .pub file
<code>autossh -N -f -L localhost:PORT:localhost:PORT [USER@HOST]</code>	map local port PORT to PORT on USER@HOST with autoreconnect

operations on files & drives

<code>cp -r \$(cat file_list.txt) outdir</code>	copies files & directories listed in file_list.txt to outdir
<code>xargs -a file_list.txt cp -r -t outdir</code>	same as above
<code>tar -v czf file.tar.gz /path/to/compress</code>	create -cf archive -xf for extract
<code>unzip file.zip -d file</code>	unzip file.zip to file directory (must exist before)
<code>mkdir -p dir</code>	make parent directories as needed, no error
<code>rm -r !(*.ext)</code>	delete everything except files with extension .ext
<code>du -hs dir</code>	check size of dir use -h for GB or -m for MB
<code>basename path/basename.ext .ext</code>	get basename from path without ext
<code>grep -i -r -E 'pattern1 pattern2 pattern3'</code>	multiple patterns with grep -i case insensitive -r recursive
<code>find PATH -iname "pattern" -type d/f</code>	list files or directories with matching pattern in specified PATH

Statements

<code>while read line; do [Command] done < input.file</code>	Loop over file content
<code>for file in /*.extension; do [Command] done</code>	loop over files in directory
<code>if test -f file.txt; then [Command] fi</code>	check if file exists -f, -d for directory
<code>if [-f file.txt]; then [Command] fi</code>	same different syntax
<code>if [-z "\$1 "]; then fi</code>	checks if arg \$1 is empty
<code>function function_name { <commands> }</code>	function declaration, \$1 \$2 - argument names
<code>" \$?"</code>	return exit status from last command
<code>\$(expr)</code>	evaluate expr and store/print its result

system

<code>cat /proc/cpuinfo #or lscpu</code>	cpu informations
<code>uname -a</code>	OS informations
<code>ss -tpln</code>	show forwarded ports
<code>lsblk -S</code>	list block devices -S for minimal view
<code>dd if=/path/to/image.iso of=/drive/location bs=4M && sync</code>	create bootable drive from image.iso
<code>sudo mount [drive] [mount point]</code>	mounts drive at mount point
<code>kill -9 \$(pgrep -f [pattern])</code>	terminate all processes matching pattern
<code>printenv</code>	print all env variables

git

<code>git rm -r --cached <path/file.ext></code>	remove untracked files
<code>git clean -d -n/f</code>	remove undone changes add: -n to show files to remove or -f to remove them
<code>git fetch --all [branch_name]</code>	copies all changes from last pull/clone on current branch or given branch name

git (cont)

```
git log --not --remotes
```

all commits on all branches that aren't pushed yet

```
git checkout -b <new_branch>
```

change & create new branch

```
git switch -c <new_branch>
```

same as above
