

Definitions

Prevalence rate: how frequently a disorder exists within a population.

Incidence: the number of new cases diagnosed in a certain period of time within a population, often reported over a 12-month period.

Lifetime prevalence: the proportion of a population that at some point in life has ever had the disorder.

Aim

how depression could be linked to social factors and stressful life-events in women

Prs

458 women in South London

Method

survey on their daily life and depressive episodes - focus on important biographical details, ie. particular life events or particular difficulties. These events were later rated in severity by independent researchers.

Result

8% (37) became clinically depressed in the previous year. 33 (nearly 90%) experienced an adverse life event or a serious difficulty (e.g. loss of a loved one, abusive relationship). Only 30% of the women who did not become depressed suffered from such adversity.
