

Basics		Basics (cont)		Basics (cont)	
cd [path]	change your current directory to the specified one	chown	changes the owners of a given file or folder	head [file]	prints
cd ~	go to your home folder	user:group [name]		tail [file]	prints
cd -	go to the folder you were before	chown -R	changes the owners of a given file or folder, and all of its contents	cut -f [field]	allow
ls	list the contents of the directory	user:group [name]		-d [separator]	from
ls -lh	list the contents of the directory in a human-friendly format	touch [name]	creates a file with the given name	uname	gets
cp [origin] [destination]	copies the given file wherever you want to	file [name]	reports the file type	uname -m	gets
mv [origin] [destination]	moves or renames the given file	rm [file]	removes a file	uname -r	gets
pwd	get the current directory you're in	rm -rf [file]	removes a folder and all of its contents	uname -a	show OS
mkdir [name]	create a folder	cat [file]	prints a file's contents	less [file]	prints
mkdir -p [name]	create a folder and all its parents, if needed	tac [file]	prints a file's contents from bottom to top	more [file]	same
chmod 755 [name]	change a file's permissions - Allows the user to read, write and execute, and anyone else to just read and execute	sed	allows replacing of contents in files with regular expressions	ln -s [source] [destination]	make source
chmod 400 [name]	change a file's permissions - Only the owner will be able to read the file	grep [pattern] [file]	prints the contents of a given file that match the given pattern	cal	prints
		tr -s [pattern]	replaces all concurrent duplicates of a given pattern	date	repor
		tr [pattern] [replacement]	replaces the given pattern with the given replacement string		
		tr -d [pattern]	removes the given pattern from a string

### Write (or append to) a file without an editor

```
cat > [file] << EOF
hello world
this is a file's content
blah blah blah
hello again
bye for now
EOF
```

In order to append to a file instead of replacing all of its contents, add two output cones instead of only one (>>).

### Command pipeline concatenation example

```
curl -s "https://developer.android.com/studio#downloads" | grep ".dmg" |
grep href | head -n1 | cut -f2 -d"=" |
tr -d '"'
```

This command will:

- download the downloads page for Android Studio
- find for the lines that contain ".dmg" within them
- filter again to get only those that contain "href"
- filter again to get only the first occurrence
- split the result to get only the second field using = as a separator

- remove any double quotation marks on the string  
The result should be a link that, when opened, will download the macOS installer for Android Studio. Please note, if the website changes, this command may not work as is.

### Manuals

Almost all programs on any Unix OS will have what's called a "man-page". This is an instruction manual with details on how to use a program.

In order to read the manual for a specific application, just type `man [application]` and you will be able to read how it works. Press "`Q`" to close the manual when you're done.

### sed examples

The `sed` command uses a string as parameter to determine what to operate, and can receive several more parameters to configure the behavior.

`sed -i 's/hello/hi/' file.txt` will replace the first instance of "hello" that the script can find at each line, and write the result at the same given file. To avoid overwriting, you can just remove the `-i` argument.

`sed -i 's/hello/hi/g' file.txt` will replace every instance of "hello" that exist in the file.

To apply the patterns from a file, use the `-f` parameter with a path to a file.

If you want to make a backup of the file, add a suffix for said file after the `-i` parameter. For example:

`sed -i".bak" 's/hello/hi/g' file.txt` will generate a file named `file.txt.bak` with the original contents.

### sed examples (continued)

Regular expressions given to sed, as mentioned earlier, are rather a pattern of
