## x86 assembly

by Kzderrick via cheatography.com/26001/cs/7101/

### Jump Instructions

JZ Jump if zero ZF = 1

JNZ Jump if not zero ZF = 0

JC Jump if carry CF = 1

JNC Jump if not carry CF = 0

JO Jump if overflow OF = 1

JNO Jump if not overflow OF = 0

JS Jump if signed SF = 1

JNS Jump if not signed SF = 0

JP Jump if parity (even) PF = 1

JNP Jump if not parity (odd) PF = 0

### Data Types

BYTE 8-bit unsigned integer.

SBYTE 8-bit signed integer.

WORD 16-bit unsigned integer

SWORD 16-bit signed integer

DWORD 32-bit unsigned integer.

SDWORD 32-bit signed integer.

### Arrays - (from book pg 120-124)

```
.data
    arrayB BYTE 10h,20h,30h
.code
    mov ESI,OFFSET arrayB
    mov AL,[ESI]
    inc ESI
-----OFFSET-----
.data
    arrayW WORD 1000h,2000h,3000h
.code
    mov ESI,OFFSET arrayW
    mov AX,[ESI]
```

### LOOP

```
.data
    mov ax,0
    mov ecx,5
.code
    L1:
        inc ax
    loop L1
```

### ASCII

Dec	Hx	Oct	Html	Chr	Dec	Hx	Oct	Html	Chr	Dec	Hx	Oct	Html	Chr

### FLAGS (cont)

- The Zero flag (ZF) is set when the result of an arithmetic or logical operation generates a result of zero.

- The Auxiliary Carry flag (AC) is set when an arithmetic operation causes a carry from bit 3 to bit 4 in an 8-bit operand.

- The Parity flag (PF) is set if the least-significant byte in the result contains an even number of 1 bits. Otherwise, PF is clear. In general, it is used for error checking when there is a possibility that data might be altered or corrupted.

### TEST Instruction

Performs a nondestructive AND operation between each pair of matching bits in two operands. No operands are modified, but the Zero flag is affected.

Example: jump to a label if either bit 0 or bit 1 in AL is set.

```
test al,00000011b
```

```
jnz ValueFound
```

### ROT SHIFT

SAL (shift arithmetic left) is identical to SHL.

SAR (shift arithmetic right) performs a right arithmetic shift on the destination operand.

ROL (rotate left) shifts each bit to the left

The highest bit is copied into both the Carry flag and into the lowest bit

No bits are lost

ROR (rotate right) shifts each bit to the right

The lowest bit is copied into both the Carry flag and into the highest bit

No bits are lost

RCL (rotate carry left) shifts each bit to the left

Shifts a destination operand a given number of bits to the right

The bit positions opened up by the shift are filled by the least significant bits of the source operand

The source operand is not affected

Copies the Carry flag to the least significant bit

### FLAGS

- The Carry flag (CF) is set when the result of an unsigned arithmetic operation is too large to fit into the destination.

- The Overflow flag (OF) is set when the result of a signed arithmetic operation is too large or too small to fit into the destination.

- The Sign flag (SF) is set when the result of an arithmetic or logical operation generates a negative result.

## ROT SHIFT (cont)

Copies the most significant bit to the Carry flag  
RCR (rotate carry right) shifts each bit to the right  
Copies the Carry flag to the most significant bit  
Copies the least significant bit to the Carry flag  
Shifts a destination operand a given number of bits to the left  
The bit positions opened up by the shift are filled by the most significant bits of the source operand  
The source operand is not affected  
Syntax:  
SHLD destination, source, count

## OR, XOR, AND, NOT

OR destination, source. 0,0=0. 0,1=1, 1,0=1.  
1,1 = 1  
XOR destination, source. 0,0=0. 0,1=1, 1,0=1.  
1,1 = 0  
NOT destination...invert all  
AND destination, source 0,0=0. 0,1=0, 1,0=1.  
1,1 = 1

## Procedures

```
SumOf PROC
    add EAX, EBX
    add EAX, ECX
    ret
SumOf ENDP
END main
```

## Irvine 32 lib procedures

```
DumpMem
    mov ESI,OFFSET array
    mov ECX,LENGTHOF array
    mov EBX,TYPE array
    call DumpMem

ReadChar
    char BYTE ?
    .code
    call ReadChar
    mov char, AL

Random32
```

## Irvine 32 lib procedures (cont)

```
call Random32
    mov randVal, EAX
ReadDec ;same for dec, hex, int
    intVal DWORD ?
.code
    call ReadDec
    mov intVal,eax
ReadString
.data
    buffer BYTE 21 DUP(0) ; input
buffer
    byteCount DWORD ? ; holds
counter
.code
    mov EDX,OFFSET buffer ; point to
the buffer
    mov ECX,SIZEOF buffer ; specify
max characters
    call ReadString ; input the
string
    mov byteCount, EAX ; number of
characters
```

```
WriteChar
    mov AL, 'A'
    call WriteChar
WriteDec,hex,int
    mov eax,295
    call WriteDec
WriteString
.data
    prompt BYTE "Enter your name: ",0
.code
    mov edx,OFFSET prompt
    call WriteString
```

## Unsigned Comparison

Mnemonic	Description
JA	Jump if above (if leftOp > rightOp)
JNBE	Jump if not below or equal (same as JA)
JAE	Jump if above or equal (if leftOp ≥ rightOp)
JNB	Jump if not below (same as JAE)
JB	Jump if below (if leftOp < rightOp)
JNAE	Jump if not above or equal (same as JB)
JBE	Jump if below or equal (if leftOp ≤ rightOp)
JNA	Jump if not above (same as JBE)

## PUSHAD POPAD

The PUSHAD instruction pushes all of the 32-bit general-purpose registers on the stack in the following order: EAX, ECX, EDX, EBX, ESP (value before executing PUSHAD), EBP, ESI, and EDI. The POPAD instruction pops the same registers off the stack in reverse order.

## Signed

Mnemonic	Description
JG	Jump if greater (if leftOp > rightOp)
JNLE	Jump if not less than or equal (same as JG)
JGE	Jump if greater than or equal (if leftOp ≥ rightOp)
JNL	Jump if not less (same as JGE)
JL	Jump if less (if leftOp < rightOp)
JNGE	Jump if not greater than or equal (same as JL)
JLE	Jump if less than or equal (if leftOp ≤ rightOp)
JNG	Jump if not greater (same as JLE)

## MUL IMUL

In 32-bit mode, MUL (unsigned multiply) instruction multiplies an 8-, 16-, or 32-bit operand by either AL, AX, or EAX

```
.data
val1 WORD 2000h
val2 WORD 100h
.code
mov ax,val1
mul val2 ; DX:AX = 00200000h, CF=1
IMUL (signed integer multiply )
multiplies an 8-, 16-, or 32-bit
signed operand by either AL, AX, or
EAX
Preserves the sign of the product
by sign-extending it into the upper
half of the destination register
mov eax,4823424
mov ebx,-423
imul ebx ; EDX:EAX =
FFFFFFFFFF86635D80h, OF=0
```
