

### Linear Functions

**Standard/General form:**  $f(x) = ax + b$

**Slope/rate of change**  $a/m = y_2 - y_1 / x_2 - x_1$

**y-intercept**  $b$

**Slope intercept form**  $f(x) = mx + b$

**Point-slope form**  $y - y_1 = y_2 - y_1 / x_2 - x_1 (x - x_1)$

Variable occurs to the **first power only**

The graph is a line

Constant rate of change

Positive rate of change  $\rightarrow$  Slope Upward

Negative rate of change  $\rightarrow$  Slope Downward

### Effects of Changing h and k

vertex form:  $(h, k)$

Changing h  $x = h$ ; horizontal shift

Changing k  $y = k$ ; vertical shift

### How to solve Polynomial Functions

1. Factor out (no exponent is inside the parenthesis)

2. Set the function equal to zero

3. Solve for x

4. Find Multiplicity

5. Find x and y intercept. Use 0, if imaginary use 2 numbers that are symmetric to each other

6. Plot out the x you solve on step 3 sa x-axis

7. Plot the x and y intercepts on step 5

7 Check if tama ang graph using ang leadig coefficient

### Create Quadratic func. with the Vertex and points

1. Substitute the vertex to the function

2. Substitute x and y intercept

3. Solve for a

### Formula:

$$a^3 + b^3 = (a+b)(a^2 - ab + b^2)$$

### Quadratic Functions

**General form**  $f(x) = ax^2 + bx + c$

**Standard form**  $f(x) = a(x - h) + k$

**Vertex**  $(h, k)$

Polynomial function of degree 2

Graph of f is a **parabola**

Parabola opens upward  $a > 0 (+)$  : minimum

parabola opens downward  $a < 0 (-)$  : maximum

### How to graph Quadratic Functions

1. Expressing in standard form by completing the square or using  $x = -b/2a$

2. Find Vertex

3. Identify max/min

4. Find x and y intercept

5. Plot Vertex and points

6. Find domain ad range **Note:** Domain is always real number

### Even Coefficient Graph

**Same Direction sa start and end** If Positive:

Upward If Negative: Downward

### Odd Coefficient

### Polynomial Function

**Example sa form**  $f(x) = 2x^3 - 6x^2 + 10$

Exponents Always positive exponents and no fractional exponents

Coefficients 2, -6

Constant 10

coefficient/-

Constant term

Leading coeffi- 2  
cient

Leading term  $2x^3$

It is continuous; graph has no breaks or holes

**Note:** Dapat always sunod ang mga terms depende sa # of degree or exponents. If kulangan butangan ug 0<sup>ang</sup> exponent

**Higher exponent (even)** Steeper, flatter

**Higher exponent (odd)** wider

### Remainder Theorem

$$P(x) = \frac{x^3 - 4x^2 - 3x + 10}{x - 2}$$

$$x - 2 = 0$$

$$x = 2$$

$$P(2) = (2)^3 - 4(2)^2 - 3(2) + 10$$

$$= -12 \leftarrow \text{remainder}$$

If a polynomial  $p(x)$  is divided by the binomial  $x - a$ , the remainder obtained is  $p(a)$

### Factor Theorem

$$p(x) = \frac{x^3 - 3x^2 + 3x - 1}{x - 1}$$

$$x - 1 = 0$$

$$x = 1$$

$$p(1) = (1)^3 - 3(1)^2 + 3(1) - 1$$

$$= 0 \leftarrow \text{Factor}$$

$$p(x) = \frac{x^3 - 3x^2 + 3x - 1}{x - 1} = 1x^2 - 2x + 1$$

$$p(x) = x^3 - 3x^2 + 3x - 1 = (x - 1)(x^2 - 2x + 1)$$

$$= (x - 1)(x - 1)(x - 1)$$

$$= (x - 1)^3$$

C is a zero of p if and only  $x - c$  is a factor of  $P(x)$

**Opposite Directions** If Positive: ascending, If Negative: descending
