

Entities

Entity Any defined chunk of data in Drupal. like nodes, users, taxonomy terms, etc. some entity type can have multiple bundles.

Entity type

bundle A specific implementation of an entity type. For example, the node (content) entity type has bundles called content types.

Content type Every node belongs to a single content type, which defines various default settings for nodes of that type, like different fields.

Node A piece of content in Drupal, usually has a title, an optional body, and perhaps additional fields. Every node belongs to a particular content type.

note???

General

NID Node ID. The unique identifier for each node

TID Term ID. The unique identifier for each term.

UID User ID. The unique identifier for each user.
