

Unit Test

Validate the correctness of individual transformation logic (e.g., filters, mappings, UDFs)

Regression Test

Confirm that new changes haven't broken existing logic or outputs

Integration Test

Ensure multiple components (e.g., joins, aggregations, pipelines) work together as expected

Business Rule Test

Enforce domain-specific rules

Data Quality Test

Check for data hygiene issues like nulls, duplicates, schema mismatches, and format violations

Performance Test

Measure speed, memory, partitioning
