Defining a function

```
# Exampe
def greet_user():
  """Display a simple greeti-
ng."""
  print("Hello!")
greet_user()
```

Passing Information to a Function

```
def greet_user(username):
  """Display a simple greeti-
ng."""
  print("Hello, " + username)
  greet_user('jesse')
```

variable username

he variable username in the definition of greet_user() is an example of a parameter, a piece of information the function needs to do its job. The value 'jesse' in greet_user('jesse') is an example of an argument. An argument
is a piece of information that is passed from a function call to a function.

Passing Arguments

We pass infomation to a function using parameters and arguments

keyword arguments

if you combine both positional and keyword arguments when calling a function, then make sure keyword arguments come after positional arguments. If they come before, you'll get an error
