

Test

Template literal text `\${200 / 100}`

Postfix increment i++

Prefix ++i

Operator precedence link

Executing a function is called *invoking*, *calling*, or *applying* it.

Array is not empty array && array.length

Get function parameter (inside function) arguments[0], arguments.length

Being able to reference a specific instance of a local binding in an enclosing scope—is called **closure**. A function that references bindings from local scopes around it is called a **closure**.

Object

property: value

"property one": value

if property doesn't exist obj.prop returns *undefined*

prop in obj return *true* or *false*

object.keys() array of property names

array arr1 instanceof Array

Object

property: value

"property one": value

if property doesn't exist obj.prop returns *undefined*

prop in obj return *true* or *false*

object.keys() array of property names

array arr1 instanceof Array

Array.isArray(arr2)

C
