Before review

The project is documented using a README.md in github and draw.io diagram (later Confluence)

Purpose and general description of the project

The business logic has to be tested (Unit and IT are passing)

There are no new blocker, critical or major sonar issues (encouraged to solve old issues but not mandatory)

Dependency convergence is 100% (if it is less, there has to be a reason)

REST endpoints are documented in a swagger file (OpenAPI v3) in the contracts github repository

There are valid test urls in the swagger file

Only necessary metrics are pushed to monitoring systems (e.g. datadog)

After review

There are no SNAPSHOT dependencies

The change has been deployed or there is a deployment story

Infrastructure that is no longer needed has been deleted (message queues, config files and folders etc.)

There is a DataDog dashboard for the corresponding system

At least the service you worked on should be in this dashboard

There are alerts on the most important metrics

For services, there is logging to Kibana and/or local files

If not all points could be finished, there is create technical debt issue with the label "dp-tech-debt" to do it

Notes

Developer is responsible for closing the feature branch (not the reviewer unless it was decided)

Applies to anything that has to be done (e.g. Epic, Story, Bug, etc.)
