

### History and Origins

James Ussher, 1648 (not an archaeologist) - The bishop that used the bible to try to determine the day the earth was created. He figured it was Oct. 23 4004BC

The bible is how history and the role of humanity was understood

### The Ages

Age of Discovery - Things were found that couldn't be explained. Stone tools, and fossils of animals that did not exist. Maybe Dragons.

Age of Reason - Ways of thinking were changing. Geological time and Stratigraphy were used. Uniformitarianism, same process today as in the past, and Superposition, stuff on top is younger than the stuff below. Maybe not dragons.

Age of Science - Used empirical studies opposed to faith. Descartes' Empiricism, believe what you can see, touch, and measure. Galileo, Math and physics. Hobbes, Man in nature lives a nasty brutal life, while Europe exists because of laws and authority. No dragons.

Age of Exploration - New places were found that were unknown (not in the bible), and other people were discovered in these lands. Maybe sea dragons

### Archaeology

Invented as a means to create a new origin story after disenchantment w/ biblical history  
- Interested in pre history

### Archaeology (cont)

- Creating a global inventory of history

- Finding human origins

- Finding human nature/reason for existence

### Stages

1. Antiquarians - Rich white guys that were treasure hunters. No much about science more about exploring and status

2. Scientists - Rich white guys that were interested in empirical evidence of the world. Evolution and classification became popular. Taxonomy, like with like these all have feathers

3. Anthropologists - Rich white guys with relativist views. Aligned with history and interested in particular cultures. Emphasis on a holistic approach.

4. Today - Extremely diverse, concerned with relevance, ethics, and heritage. Looking for missing links, and repatriation in important.

The study of all people, past and present, their things and the relationship b/w them.

No dinosaurs

### Biases

Biblical - god on top and different bodies and elements going down.

Unilinear - Progress, Change over time, humans went through stages such as savagery (less European), Barbarism, Civilized (more European). Closer to civilized you are the closer to god you are.

### Biases (cont)

Pre History does not rely on writing. Time out of mind, before memory, and immemorial

Development of Archaeology Started at home to find the earliest "Europeans", and the qualities that made up "civilization"

Skulls and scientific racism

### Culture

Culture - is the learned, shared ideas and behaviour passed down through generations w/in a group

Archaeologists study material culture They figure out how to use it what it meant to people.

Direct analogy- if it looks like a hammer its probably a hammer

Indirect Analogy - People who live in forests use hammers to wood work the artifact was found in the forest therefore it probably is a hammer

Ethnography - study by observation, field work participating and observing, surveys, mapping, interviews

### Methods

Excavation - helps get information from the past. Principle of superposition. Stuff above is younger than stuff below.

Stratigraphy - the study of how a site was constructed through time in a logical sequence.

Dig down, analyze up.

Everything in one layer came from the same period (In situ or in context).

If layers are disturbed you cannot date.

### Dating

Relative dating - determining the relative age in relation to each other. This just tells you that one is younger than the other, not exact dates.

Absolute dating - determines chronological age, carbon dating is most common determines ages up to 35,000 to 40,000

### Analysis

Artifacts - objects made or used by humans or hominins, the foundation of archaeology

Osteology - study of bones. Foundation of physical anthropology

Lithics - the analysis of stone tools. preservation bias stone doesn't decay

Chipped stone technology Start with large rock then chip away to make your tool Need hammer stone And Core material being chipped Flakes chip broken off. Lithic debitage - left overs from the chipped stone Figure out what it's made out of using comparative collection. Then figure out what it was used for.

Ceramic analysis Technology of production Start with nothing and build something opposite of lithics Look at fabric, form, and style Basket and pottery can be made in many different ways This makes it more sensitive to cultural imprinting and identity
