## 115.114 Finance Fundamentals. Chpt4&6 Cheat Sheet by MJ McGiver via cheatography.com/213568/cs/46481/

Chpt4. TVM-Single Payments			
Time	Individuals prefer to receive a dollar today to receiving		
Value of	that same dollar promised in a year's time.		
monev			

Interest	The cost of funds to a borrower or part of the return for a lender or investor
Mortgage	recover money by selling property
Term Loan	bank loan with maturity <sup>due date</sup>

#### 4.1 Simple Interest & Future Value

Future Value	<i>amount received later</i> , cash value of investment at future date: FV=P(1+rn)
Simple Interest	<i>Interest calculated on the original amount</i> I=(P) ( r) (n)
Money Markets	<i>short-term debt markets</i> : companies can borrow/ invest in the short-term.
Formula	FV = P(1 + rn)

4.2 Simple Interest & Present Value			
Present Value	<i>amount today</i> : needed cash today, to yield a particular value at future.		
Discounts	to find the present value of future amount. inverse for compounding interest.		
Formula	PV = FV/(l+rn)		

Working out/ Calculating how much the money we expect to receive in the future is worth today.

#### 4.3 Compound Interest & FV

Compounded Interest	Interest is stacking. It is then added to the principal
Compou- nding	Process of finding future amounts where interest is paid on interest already earned.
Opportunity Cost	<i>best market yield achieve through alternative course</i> <i>of action</i> : Market Yield is often benchmarked for opportunity costs
Formula	$FV = PV (1+r)^n$

Working out/ calculating future value through interest for each period (plus any interest), then added to the principal.

Discou- ntingThe process of finding current amounts by the process of present value.Formula $PV = FV / (1+r)^n$ Formula2 $PV = FV \times (1+r)^{-n}$ 4.5 Compounding frequencyCouponInterest paid, based on a percentage of a bond's face value.Zero-single-payment: no interest payment during its lifetime coupon since interest is included with the repayment of principal Bond at maturity.	4.4 PV of a single payment		
Formula2       PV = FV x (1+r) <sup>-n</sup> 4.5 Compounding frequency         Coupon       Interest paid, based on a percentage of a bond's face value.         Zero-       single-payment: no interest payment during its lifetime since interest is included with the repayment of principal		, , , ,	
4.5 Compounding frequency         Coupon       Interest paid, based on a percentage of a bond's face value.         Zero-       single-payment: no interest payment during its lifetime since interest is included with the repayment of principal	Formula	$PV = FV / (1+r)^n$	
CouponInterest paid, based on a percentage of a bond's face value.Zero- couponsingle-payment: no interest payment during its lifetime since interest is included with the repayment of principal	Formula2	$PV = FV \times (1+r)^{-n}$	
CouponInterest paid, based on a percentage of a bond's face value.Zero- couponsingle-payment: no interest payment during its lifetime since interest is included with the repayment of principal			
value.         Zero-         coupon         since interest is included with the repayment of principal	4.5 Compo	unding frequency	
coupon since interest is included with the repayment of principal	Coupon		
	coupon	since interest is included with the repayment of principal	
Maturity Deadline: The date when security will be payed.	Maturity	Deadline. The date when security will be payed.	

Formula	FV	=	ΡV	Х	(1	+	r/m)"		**
Formula2	PV	=	FV	/	(1	+	r/m) <sup>m</sup>	Х	n

When compounding period per year is increased by *semi-annually, quarterly, monthly or daily.* 

PV formula can be used to calculate the current value of a zero-coupon bond.

4.6 Continuous compounding/ discounting		
Formula	$FV = PV (PV \times e^{r \times n})$	
or	FV = PVe <sup>rn</sup>	

When compounding frequency is increased to a very large number of (infinity).

#### Where e is constant, e = 2.718

4.7 Nominal & Effective Interest Rates				
Nominal Rate	contractual rate, ignores compounding. includes inflation: quoted rate			
Effective Rate	actual rate, accounts compounding. includes adjust- ments: adjustments to nominal rate for the frequency of compounding.			
Annual Percentage Rate (APR)	contractual rate, ignores compounding. when short- term rates are annualized			
Rate of Return	rate of profit/ loss from investment			
Formula	$r_{e} = (1 + r/m)^{m} - 1$

## Cheatography

## 115.114 Finance Fundamentals. Chpt4&6 Cheat Sheet by MJ McGiver via cheatography.com/213568/cs/46481/

#### 6.4 Risky Assets (cont)

Exchange	The chances of losing money from changes in offshore
rate risk	currencies relative to the local currency: Adverse
	movements in exchange rates can erode the level of
	return the investor expects to receive.
Country	Uncertainty of return from investments in another
Risk	country: level of risk differs from country to country.

The greater the risk, the higher the premium to compensate.

# 6.5 Measuring historical risk and returnEx Antebefore the eventEx Postafter the event

EXPOSI	
Holding Period	the length of time an investment is owned
Holding Period	investment's percentage return over the
Yield (HPY)	period it was owned.

# 6.6 Standard deviation as a measure of risk Variance measures how far each return is from the mean (average) of all returns. Standard measures the variability of a set of values Deviation Variance

 6.7 Standard deviation as a measure of risk

 Variance
 measures how far each return is from the mean (average) of all returns.

Standardmeasures the variability of a set of valuesDeviation

### 6.8 Risk averse investors' investment rules

**Investment rule 1:** If two investment choices have the same expected returns, select the one with the lower expected risk.

**Investment rule 2:** If two investment choices have similar risk profiles, select the one with the higher expected return.

An investor's tolerance for and attitude towards risk matters.

In a world fraught with uncertainty and risk, diversification is the key.

Diversifi- cation	The practice of spreading wealth over a variety of different assets.
	Diversification works to reduce risk (variability), because it is unlikely that all investment assets will perform in exactly the same way.
Diversify	<i>Place funds in a range of assets in order to spread risk:</i> objective of investments.
Unsyst- ematic Risk	Risk that can be minimized by diversification
Systematic Risk	<i>Non-diversifiable risk:</i> pertaining to uncertainty surrou- nding future economic conditions that affects all companies. e.g. war, international incidents, and inflation.
	The higher the systematic risk, the higher the return investors will be compensated.

Some investments will perform well when others are performing poorly, so that the returns on assets will not move in the same direction at the same time.

6.10 CAPM	
Capital Asset Pricing Model (CAPM)	calculates the required rate of return of risk assets.
Market Risk Premium (MRP)	extra return investors require to compensate them for investing in the market portfolio.
