fzf in zsh Cheat Sheet

by mliebelt via cheatography.com/122244/cs/35729/

Installation

Do install zsh in your Linux distribution, and on top of it, install oh-my-zsh. See Installing ZSH how to do that.

Then do install oh-my-zsh on top of that. See Install Oh-My-Zsh on how to do that.

Last ensure that `fzf` is installed on your system. See fzf installation on how to do that.

Configuration

Then you have to configure `oh-my-zsh` so that `fzf` is configured as well.

Find in the configuration file the lines that enables the plugins

```
plugin s=(...)
```

Add to that list `fzf`

Additional Resources

Using FZF to Preview Text Files on the Command Line and within Vim	https://youtu.be/aLMepxvUj4s

fzf explicit usage

You may call fzf without any argument directly from the command line, which then results in scanning the current directory and sub-directories for files. By entering then search terms (with multiple ones separated by SPACE), the list of matches gets more concrete
