Vocabulary

str	string
int	integer
float	decimal number
syntax	the structure of a program
syntax error	An error in a program that makes it impossible to parse
len	Return the length of an object
Modulus(%)	Show the remainder of the division
Single Equal (=)	assigns the value on the right to a variable on the left
Double Equal (==)	test if the 2 value are the same
String	a series of sentences that the user will use. Usually surrounded by double quotes
Variable	A thing that can be changed
input	convert things you enter

List

```
import random
intlist = [1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12]

Symbol

if/elif/else	conditionals
While	loop
for	list all the thing
!=	If values of two operands are not equal, then condition becomes true.
==	test if the 2 value are the same
<	less than
<=	If the value of left operand is less than or equal to the value of right operand, then condition becomes true.
>	greater than
>=	If the value of left operand is greater than or equal to the value of right operand, then condition becomes true.

Guess word game
