Cheatography

Machine Learning Cheat Sheet

by Molly_6075 via cheatography.com/193986/cs/40757/

Time Series

时间格式统一	
df['Date'] = [datetime.strptime(x, "%b-%y") for x in df.Period]	新建一列存放时间，依据原本period列中 Jan-2021的日期形式改成2021-01-01的标准形式
df_b['Date'] = [datetime.strptime(x, "%d/%m/%y") for x in df_b.iloc[:,0]]	
列名操作	
df.columns = ["Period", "GoldPrice", "BondYield"]	更改列名
df.columns = [each.strip() for each in df.columns]	去除列名前后的空格
数据提取	
df_gold = df[df.Gold.isna() == False].loc[:, ["Top Producers","Gold"]]	取指定列的非空行
绘图	
df.groupby("Date").Gold.mean().plot(kind="line")	按日期分组，统计黄金的均值，并绘制折线图
df.loc[:, ["Gold", "Silver","Date"]].groupby("Date").mean().plot()	按日期分组，同时统计黄金、银的均值，并绘制折线图
df.groupby("month")[["column0","column1","column2"]].mean().plot()	写法2
df.plot(kind="line", y="Gold ETF", x="Date")	指定横纵坐标绘制折线图
sns.heatmap(df.loc[:, ["Gold", "Platinum","Silver"]].corr(), annot=True)	先计算黄金银铂金两两之间的相关关系，并依据结果绘制热力图
sns.barplot(data=df_platinum,y="Platinum", x ="Top Producers")	运用seaborn绘图（import seaborn as sns）

Boost Classifier

SVM (cont)

AdaBoost	
from sklearn.ensemble import AdaBoostClassifier	导入AdaBoost
classifier = AdaBoostClassifier(n_estimators=3,learning_rate=0.2, random_state=0)	参数设置
classifier.fit(x_train, y_train)	y_pred = classifier.predict(x_test)
from sklearn.model_selection import GridSearchCV	最优参数选择
param_grid = {'n_estimators': [1,10,100],'learning_rate': [0.2,0.4,0.6,0.8]}	grid = GridSearchCV(AdaBoostClassifier(),param_grid, scoring ='accuracy')
grid.fit(x_train,y_train)	grid.best_estimator_, grid.best_params_, grid.cv_results_
GradientBoost	
from sklearn.ensemble import GradientBoostingClassifier	导入GradientBoost
classifier = GradientBoostingClassifier(n_estimators=1, learning_rate=0.4,max_depth=1, random_state=0)	classifier.fit(x_train, y_train)
param_grid = {'n_estimators': [1,10,100],'learning_rate': [0.2,0.4,0.6,0.8]}	grid = GridSearchCV(GradientBoostingClassifier(),param_grid, scoring ='accuracy')
grid.fit(x_train,y_train)	grid.best_estimator_, grid.best_params_, grid.cv_results_

SVM	
标准化处理，将数字型的变量转换为-1到1的区间里	from sklearn.preprocessing import StandardScaler
ss = StandardScaler()	x_transformd = ss.fit_transform(x)
分割训练集和测试集	from sklearn.model_selection import train_test_split
x_train,x_test,y_train,y_test = train_test_split(x_transformd,y,test_size=0.3,random_state=0)	按照训练集70%划分
支持向量机回归	from sklearn.svm import SVR
y_pred_SVR = regression.predict(x_test)	用训练集做拟合，测试集预测结果
regression = SVR()	regression.fit(x_train,y_train)
支持向量机分类器	from sklearn.svm import SVC
df["y"] = pd.cut(x = df.col0, bins=[0,6,10],labels=[0,1])	依据col0列的值划分成两组，0-5一组，6-10另一组，并保存在新列中（categorical Y适用于分类器）
classifier = SVC(kernel=kernel,random_state=0)	kernel还可选择'linear','poly','rbf','sigmoid'，准确率随之改变
classifier.fit(x_train,y_train)	y_pred = classifier.predict(x_test)
结果评估	
回归适用	from sklearn.metrics import mean_squared_error, mean_absolute_error
mean_absolute_error(y_test,y_pred_SVR)	MAE预测值和实际值之间绝对误差的平均值
mean_squared_error(y_test,y_pred_SVR)	MSE预测值和实际值之间误差的平方的平均值
分类适用	from sklearn.metrics import confusion_matrix, accuracy_score, classification_report
accuracy_score(y_test,y_pred))	accuracy = (TP+TN)/(TP+TN+FP+FN)
confusion_matrix(y_test, y_pred)	详细的TP, TN, FP, FN的数量
classification_report(y_test, y_pred)	包括了准确率、召回率、F1分数和支持度等指标

Feature Engineering

pip install scikit-image	安装包
读取图片并展示	from skimage import io
food = io.imread("chips1.jpg")	io.imshow(food)
变化图片颜色	from skimage.color import*
io.imshow(rgb2gray(food))	将彩色图片转换为灰色并展示
给图片加滤镜	from skimage.filters import *
io.imshow(laplace(food,ksize=3, mask=None))	使用Laplace filter并设置内核大小为3
更改图片尺寸	from skimage import transform
image = transform.resize(image,(2000,2000)) print(image.shape)	更改为指定尺寸并检查更改后的大小
主成分分析	from sklearn.decomposition import PCA
pca = PCA(n_components=30).fit(chip)	降维并保留30个主成分，将PCA模型拟合到chip图像数据上
x_new = pca.transform(chip)	使用已经训练好的PCA模型，将chip图像数据投影到新的特征空间中（包含30个重要特征）
recdata = pca.inverse_transform(x_new)	建了图像数据，只使用了30个主成分来表示原始图像
os.listdir(".")	列出当前工作目录内的所有文件名和目录名
os.chdir(“directorypath”)	改变工作目录
os.getcwd()	获取当前的工作目录

K-NN

导入K-NN	from sklearn.neighbors import KNeighborsClassifier
classifier = KNeighborsClassifier(n_neighbors=6)	n_neighbors的默认值是5
classifier2.fit(x_train,y_train)	训练模型
accuracy_score(y_test,classifier2.predict(x_test))	得出准确率

Text Analytics

s.strip	删除尾端全部空格，s为字符串名
a.upper( )/ a.lower	将字符串a转换成大写、小写形式
分词 Tokenization	import nltk
tokens = nltk.word_tokenize(text)	读取长文本并根据空格和标点分词
打开文件并读取	with open ('sample.txt','r',encoding='utf-8') as f: tokens = nltk.word_tokenize(f.read())
词性标签Part-of-speech(POS) Tagging	nltk.download('averaged_perceptron_tagger')
tagged = nltk.pos_tag(tokens)	给分词后的每个单词加个标签
删除前后缀 Stemming(可能产生invalid word)	from nltk.stem import PorterStemmer
ps = PorterStemmer()	print(ps.stem('campaigning'))
词形还原 Lemmatization (generally valid)	from nltk.stem import WordNetLemmatizer
wnl = WordNetLemmatizer( )	wnl.lemmatize('beaten','v')
情感分析	from nltk.sentiment.vader import SentimentIntensityAnalyzer
nltk.download('vader_lexicon')	analyzer = SentimentIntensityAnalyzer( )
analyzer.polarity_scores(text)['compound']	分析长文本的情感色彩并得出综合分数

Text Analytics (cont)	
for index, row in df.iterrows( ): compound_score = analyzer.polarity_scores(row['clean_text'])['compound']	dataframe中按行读取cleaned_data列的每一条数据，并得出综合得分

Web scrapping	
import request	用于发送 HTTP 请求
response = request.get(url)	获取数据
result = response.json(	加工数据并print
Beautiful Soup	
from bs4 import BeautifulSoup	解析和处理网页
r = requests.get(url)	请求网址，其中url为包含网址的变量
print(soup.title)	获取网页的标题
soup = BeautifulSoup(r.content, 'html.parser')	解析获取到的内容
title= soup.find_all("h6", "h6 list-object__heading")	运用find_all查找指定内容第一个变量是tag,第二个变量为class（查找新闻标题）
each_title = title.text	通过.text获取标题内容
each_title = each_title.strip()	删除标题前后的空格，之后print(each_title)
data2 = r.json()	将请求的结果转换成json字符串
data2.keys()	查看json中包含的键
data2['help']	help是其中一个键名(keys)
data2['result']['records']	直接通过json中的层级关系查找内容
