## Rules for Counting Significant Figures

## For numbers greater than 1

-All non-zero digits are significant
-All zeroes between two non-zero digits are significant. The location of the decimal does not matter.
-If the number is without a decimal point, then the trailing zeroes are not significant.
-Trailing zeroes in the decimal part are significant.

## For numbers less than 1

-Any zero to the right of a non-zero digit is significant.
-All zeroes between the decimal point and the first non-zero digit are not significant,

## Fundamental or Base Quantities

The quantities which do not depend upon other quantities for their complete definition are known as fundamental or base quantities. e.g.: length, mass, time, etc.

## Derived Quantities

The quantities which can be expressed in terms of the fundamental quantities are known as derived quantities
e.g.: Speed (= distance/time), Volume, acceleration, force, pressure,
etc.

## Units of Physical Quantities

The chosen reference standard of measurement in multiples of which, a physical quantity is expressed is called the unit of the quantity.
e.g.: Physcial Quantity = Numerical Value x Unit

Error in Summation and Difference
$\mathrm{x}=\mathrm{a}+\mathrm{b}$ then, $\Delta \mathrm{x}= \pm(\Delta \mathrm{a}+\Delta \mathrm{b})$

Error in Product and Division

$$
\frac{\Delta X}{X}=|a| \frac{\Delta Y}{Y}+|b| \frac{\Delta Z}{Z}
$$

If $X=Y^{a} Z^{b}$ then the maximum possible fractional error in $X$ is given by the above equation
