Simple Values

`let` for constants; `var` for variables

Constants: value doesn't need to be known at compile time, but must assign it a value exactly once

Rule for types: constant or variable must have the same type as the value you want to assign it.

Inferring Types: Type can be inferred if value provided when creating constant/var.

Specifying types: Write after the variable, separated by colon `let explic itD ouble: Double = 70`

Values are never implicitly converted to another type. If conversion required, must be done explicitly

```
let lottoS tring = " Today's winning lotto number is "
 let lottoN umber = 94
 let lottoS entence =  lottoS tring + String (lo tto Numbe
r)
```

Backslash string interpolation

```
let friend Count = 2
let friend Cou ntS tring = "I have \(frie ndC ount) number
 of
 friend s."
```

Use three double quotation marks for strings that take up multiple lines.

Create arrays and dictionaries using brackets, and access their elements by writing the index or key in brackets.

```
var toys = ["la bub u", " sim ski ", "furby"]
 toys[1] = " fug gle r"
 toys.a ppe nd( " jel lyc at")
 var bestIt emO fThing = [ " summer fruit" : " man go",]
 bestIt emO fTh ing ["summer fruit"] = " pea ch"
```

Arrays grow automatically.

For empty array, write `excell ent Fruits = []`. For an empty dictionary, write `medioc reF ruits = [:]`.

If assigning empty array or dict to new var, you need to specify type.

```
let arrayO fGo odC off eeC afes: [String] = []
 let dictCa fes Wit hMa tch aAn dRa tings: [String: Float]
 = [:]
```

Control Flow

Control Flow (cont)

```
let scoreD eco ration = if teamScore > 10 {
 " □"
 } else {
   " "
 }
 print( " Sco re: ", teamScore, scoreD eco ration)
```

Optionals: either contains a value or contains `nil` to indicate a value is

A question mark after type of value marks it as optional.

```
var option alS tring: String? = " Hel lo"
 print( opt ion alS tring == nil)
 // prints " fal se"
```

Use `if` and `let` to work with missing values. If optional value is `nil`, c
ional is false and code in braces is skipped. Otherwise, optional value is
unwrapped and assigned to constant after `let`, which makes the unwr
value available inside block of code.

```
var option alName: String? = "Big Dog"
 var greeting = " Hel lo! "
 if let name = option alName {
   greeting = " Hello, \(name )"
 } else {
     greeting = " Wow !"
 }
```

`??` operator: If optional value missing, default value used instead

```
let holida yInNov: String? = nil
 let holida yInDec: String = " Bal i"
 let welcomeMsg = " Enjoy \(holi day InNov ?? holida
ec )"
```

Switches: support any kind of data and variety of comparisons

After executing the code inside the switch case that matched, program from the switch statement. Execution doesn't continue to the next case, don't need to explicitly break out of the switch at the end of each case's

```
let perfume = "Eau Rose"
 switch perfume {
 case " Ele ctric Cherry ":
print( " Jasmine sambac, ambret tolide musk")
 case "On a Date", "Born In Roma":
   print( " These have a black currant note.")
 case let x where x.hasS uff ix( " ros e"):
   print( "Is it a fragrance with \(x)?")
 default:
   print( "A delicious choice.")
 }
 // Prints "Is it a fragrance with rose?"
```

for-in: Use to iterate over items in a dict by providing pair of names f
key-value pair.

Conditionals: `if`, `switch`

Loops: `for-in`, `while`, `repeat - while`

Parentheses around condition/loop variable are optional, braces are required

```
let croiss ant Scores = [1.2, 2.3, 2.2, 4]
 for score in croiss ant Scores {
     if score > 2.5 {
       print( " Great croiss ant !!")
     }
 }
```

In `if` statement, conditional must be a boolean expression. `if scor e { ... }` is an error, not implicit comparison to zero.

You can assign if conditions to an assignment

```
let intere sti ngN umbers = [
  " country codes from my holida ys": [66, 1, 86, 8
,
  " cricket player s": [49, 56, 26, 30],
]

var largest = 0
for (_, numbers) in intere sti ngN umbers {
  for number in numbers {
    if number > largest {
      largest = number
    }
  }
}
```

while: condition can be at end too, to ensure loop runs at least once

```
var croiss ant sLeft = 2
while croiss ant sLeft < 100 {
    croiss ant sLeft *= 2
}
 print( cro iss ant sLeft)
// prints " 128 "
```

```
var cakesLeft = 2
repeat {
    cakesLeft *= 2
} while cakesLeft < 0
print( cak esLeft)
```

Control Flow (cont)

Keep an index in a loop: Use `...` for a range that includes both values and `..<` for range that omits upper val

```
var total = 0
for i in 0...4 {
    total += i
}
print( total)
// Prints " 10"
```

Functions and Closures

functions: Use `func` to declare a function. Call a function by following its name with a list of arguments in parentheses. Use `->` to separate the param names and types from the function's return type

```
func countr yGr eet ing (gr eeting: String, country: String) -> Stri
ng {
    return " \(g ree ting), welcome to \(coun try )."
}
greet( gre eting: " Nam ast e", country: " Nep al")
```
