

### Essential Objects

Class	Description
Part	A physical brick in the world.
Model	A container for Parts.
Folder	A container for Scripts and value objects.
Script	A container for <i>Lua</i> source code.
LocalScript	A Script that runs its code on a client.

### Basic math functions

Operation	Description
$a + b$	Adds $a$ and $b$ .
$a - b$	Subtract $a$ and $b$ .
$a * b$	Multiply $a$ and $b$ .
$a / b$	Divides $a$ by $b$ .
$a \% b$	Remainder of $a$ divided by $b$ .

Function	Description
<code>math.random(n)</code>	Returns random number from 1 to $n$ (no negatives).
<code>math.random(a, b)</code>	Returns random number from $a$ to $b$ .
<code>math.max(...)</code>	Returns the largest number.
<code>math.min(...)</code>	Returns the smallest number.

### Basic math functions (cont)

<code>math.floor(n)</code>	Rounds $n$ down.
<code>math.ceil(n)</code>	Rounds $n$ up.
<code>math.abs(n)</code>	Returns <b>absolute value</b> of $n$ .
<code>math.sqrt(n)</code>	Returns <b>square root</b> of $n$ .
<code>math.pi</code>	Approx equal to 3.14159

It's important to work out problems by hand before translating their solutions into code. **Algebra** is necessary for success. [Read about all math functions here.](#)

### String functions

Operation	Description
$a .. b$	Combine two strings.

Function	Description
<code>string.len(str)</code>	Returns length of <code>str</code> .
<code>string.upper(str)</code>	Returns <code>str</code> in upper-case.
<code>string.lower(str)</code>	Returns <code>str</code> in lower-case.
<code>string.reverse(str)</code>	Returns <code>str</code> in reverse.
<code>string.rep(str, n)</code>	Returns <code>str</code> repeated $n$ times

### String functions (cont)

<code>string.sub(str, a, b)</code>	Return substring of <code>str</code> from $a$ to $b$ .
------------------------------------	--

A **string** is a collection of characters, or text. An example of a string property is the `Name` property. [Read all string manipulation functions here.](#)

### Tables

```

local list = {1, 2, 3}
local firstNum = list[1]
list[2] = 4
print( " There are " .. #list ..
" number s")
local total = 0
for i = 1, #list do
    total = total + list[i]
end
print( "The total is " .. total)

```

Tables are a collection of values. They are defined using curly braces `{}` with values separated by commas. Access the values inside using square brackets `[]`. Tables are sometimes called **arrays**. Use a **for** loop to work with all items in a table individually. The `:GetChildren()` method returns a table of children in an object.

### Constants

game	Parent of all game services.
workspace	Container for all bricks and models are stored.
script	The currently running script.

### Finding Objects

```
workspace.Part:Destroy()
print( script.Parent.Name)
game.GetService("Tree").Clone()
```

Use a period to access an object's children.  
Use .Parent to access an object's parent.  
Use constants like game, workspace, and script to identify objects in the hierarchy.

### Creating objects

How do I create an object?

Using Instance.new (class) and setting the parent:  
object.Parent = parent

How do I access an object's properties?

Use a period (.):  
print( object.Name)

How do I set an object's properties?

Use a period (.) and equals sign (=):  
part.Transparency = .5

How do I destroy an object?

Using object :Destroy()

### Creating objects (cont)

How do I copy a preexisting object?

Using object :Clone() and setting the parent:  
newTree = workspace.Tree:Clone()  
newTree.Parent = workspace

### General Object Functions

Method name	Description
:FindFirstChild(name)	Return a child with name or nil if it doesn't exist.
:WaitForChild(name)	Pauses until a child with a name exists and returns it.
:IsA(className)	Return whether the object is a certain type of object.
:Clone()	Makes and returns a copy of an object.
:Destroy()	Permanently delete an object.
:GetChildren()	Return a list of an object's children.

These are functions (aka methods) for all classes of ROBLOX objects. [Read about all methods here.](#)

### Event basics

```
function onTouch(part)
    print( part.Name .. "
    touched me!")
end
workspace.Parent.Touched:connect (onTouch)
```

Events are specific occurrences relating to objects. When an event fires, or occurs, all connected functions are called.

### Basic functions

wait(n)	Wait n seconds then continue.
print(...)	Display something in the Output window.

### Variables

```
local myScore = 5
myScore = myScore + 1
print( myScore)
local myName = "Ozzy"
print( "My name is " .. myName)
```

Variables store data of any kind - numbers, strings, tables, objects or nil (nothing). A local variable is only accessible in the block of code it is defined in.

### If statements

```

if
workspace:FindFirstChild("Tree")
then
    print( " There is a tree
here.")
end
if coins < 5 then
    print( "You need more
money." )
else
    print( "You have enough
money! ")
end
if player.Name == " Jake" then
    print( "You are an
awesome guy, Jake")
elseif player.Name == " Sal ly"
then
    print( "You are a
sweeth eart, Sally")
else
    print( "You are a pretty
cool person ")
end

```

If statements will run their code if the value between **if/then** is true (or not nil). They can one an **else** block, or any number of **elseif** blocks.

### Loops

#### Numeric for loop

For counting numerically.  
*Example:* Count from 1 to 5:

```

for i = 1, 5 do
    print(i)
end

```

#### Generic for loop

Most often used for object children.  
*Example:* Print all children in object:

```

for i, child in pairs(object:GetChildren()) do
    print(child.Name)
end

```

#### While loop

Perform code until a condition is false.  
*Example:* Remove all children named 'Ball'

```

while object:FindFirstChild("Ball")
    object.Ball:Destroy()
end

```

#### Repeat-until loop

Perform code once, then again until a condition is true.  
*Ex.:* Copy objects until there are 5.

```

repeat
    newObject = object:Clone()
    newObject.Parent = workspace
    wait(1)
until #workspace:GetChildren() >= 5

```

Loops are used to **iterate**, or repeat code a number of times.

### Function examples

```

function sayHello()
    print( " Hello, world")
end
sayHello()
function addTwo Num bers(a, b)
    print( "The sum is:", a +
b)
end
addTwo Num bers(3, 5)
function calcul ate Squ are(n)
    do
        return n * n
    end
local result = calcul ate Squ -
are(3)

```

A function is a named block of code that can be run anywhere in code by **calling it** by name. Functions can have **arguments** (given values) and/or **return** values.
