

Entity Manager in a controller

<code>\$this->getDoctrine()->getManager();</code>	Get default entity manager
<code>\$this->getDoctrine()->getManagerForClass(MyEntity::class)</code>	Get entity specific manager

Repositories in a controller

<code>\$this->getDoctrine()->getRepository(MyEntity::class);</code>

Doctrine Query

<code>getResult(\$hydrationMode = self::HYDRATE_OBJECT)</code>	Retrieve a collection
<code>getSingleResult(\$hydrationMode = null)</code>	Retrieve a single result or exception
<code>getOneOrNullResult(\$hydrationMode = null)</code>	Retrieve a result or NULL
<code>getArrayResult()</code>	Retrieve an array
<code>getScalarResult()</code>	Retrieves a flat/rectangular result set of scalar values
<code>getSingleScalarResult()</code>	Retrieves a single scalar value or exception
<code>AbstractQuery::HYDRATE_OBJECT</code>	Object graph default
<code>AbstractQuery::HYDRATE_ARRAY</code>	Array graph
<code>AbstractQuery::HYDRATE_SCALAR</code>	Flat rectangular result with scalars
<code>AbstractQuery::HYDRATE_SINGLE_SCALAR</code>	Single scalar value
<code>AbstractQuery::HYDRATE_SIMPLEOBJECT</code>	Very simple object fast
<code>setCacheMode(\$cacheMode)</code>	
<code>Cache::MODE_GET</code>	may read, not write
<code>Cache::MODE_PUT</code>	no read, write all
<code>Cache::MODE_NORMAL</code>	read and write

Doctrine Query (cont)

<code>Cache::MODE_REFRESH</code>	no read, only refresh
<code>setCacheable(\$trueFalse)</code>	Enable/disable result caching

Magic repository functions

<code>find(\$id)</code>	Returns one entity
<code>findOneBy(\$criteria, \$orderBy)</code>	Returns one entity
<code>findBy(\$criteria, \$orderBy, \$limit, \$offset)</code>	Returns collection
<code>\$criteria = ['field' => 'value']</code>	Single field / value
<code>\$criteria = ['field' => ['value1', 'value2']]</code>	Single where-in
<code>\$criteria = ['field1' => 'value', 'field2' => 'value2']</code>	multiple fields / values
<code>\$repository = \$this->getDoctrine()->getRepository(Product::class);</code> <code>\$product = \$repository->findOneBy(['name' => 'Keyboard']);</code>	

Doctrine criteria - filtering collections

<code>where(\$Expression)</code>	Replaces previous statement
<code>[and/or]Where(\$Expression)</code>	Adds AND /OR where statement
<code>orderBy(\$array)</code>	Sets OrderBy
<code>setFirstResult(\$firstResult)</code>	Sets first result
<code>setMaxResults(\$max)</code>	Sets Maximum results
<code>\$userCollection = \$group->getUsers();</code>	
<code>\$criteria = Criteria::create()</code> <code>->where(Criteria::expr()->eq("birthday", "1982-02-17"))</code> <code>->orderBy(array("username" => Criteria::ASC))</code> <code>->setFirstResult(0)</code> <code>->setMaxResults(20)</code> <code>;</code> <code>\$birthdayUsers = \$userCollection->matching(\$criteria);</code>	

Doctrine ExpressionBuilder and Expr

<code>andX(\$arg1, \$arg2, ...)</code>	Multiple arguments AND
<code>orX(\$arg1, \$arg2, ...)</code>	Multiple arguments OR
<code>[n]eq(\$field, \$value)</code>	[Not] Equal
<code>gte</code>	Greater than [or equal]
<code>lte</code>	Less than [or equal]
<code>isNull(\$field)</code>	Is Null
<code>[not]in(\$field, array \$values)</code>	[not] In
<code>memberOf(\$field, \$value)</code>	ExpressionBuilder only Member of
<code>isMemberOf(\$field, \$value)</code>	Expr only Member of
<code>isNotNull(\$field)</code>	Expr only Is not Null
<code>between(\$field, \$x, \$y)</code>	Expr only Between \$x and \$y
<code>trim(\$field)</code>	Expr only Trim
<code>concat(\$x, \$y)</code>	Expr only Concat
<code>literal(\$string)</code>	Expr only Literal
<code>lower(\$field)</code>	Expr only Lower case
<code>upper(\$field)</code>	Expr only Upper case
<code>count(\$field)</code>	Expr only count

```
# Doctrine Expr #
Criteria::expr()->orX(
Criteria::expr()->eq('id', $facilityId),
Criteria::expr()->eq('active', TRUE)
);

# Doctrine ExpressionBuilder #
$qb = $this->createQueryBuilder('f');

$qb->where($qb->expr()->eq('id', '?arg1'))
->setParameter('arg1', $facilityId);

$qb->select($qb->expr()->substring('o.orderNumber', 4, 3));

$qb->select($qb->expr()->concat('p1.surname', $qb->expr()->literal(','), 'p1.firstName');
```

Doctrine Query Builder (cont)

<code>add(\$dqlPartName, \$dqlPart, \$append = false)</code>	
<code>\$dqlPartName:</code> select, from, join, set, where, groupBy, having, orderBy	
<i>Wrappers for add():</i>	
<code>[add]select(\$select = null)</code>	
<code>delete(\$delete = null, \$alias = null)</code>	
<code>update(\$update = null, \$alias = null)</code>	
<code>set(\$key, \$value)</code>	
<code>from(\$from, \$alias, \$indexBy = null)</code>	
<code>[inner/left]join(\$join, \$alias, \$conditionType = null, \$condition = null, \$indexBy = null)</code>	
<code>[and/or]where(\$where)</code>	
<code>[add]groupBy(\$groupBy)</code>	
<code>[and/or]having(\$having)</code>	
<code>[add]orderBy(\$field, \$order = null)</code>	

Doctrine raw SQL

<code>\$Connection = \$EntityManager->getConnection()</code>	Get connection
<code>\$Statement = \$Connection->prepare(string \$sql): Statement;</code>	Prepare statement from string
<code>\$Statement->bindValue(string int \$param, \$value, \$type = null): bool</code>	Bind a value to a corresponding name
<code>\$Statement->execute(?array \$params = null): bool</code>	Execute the statement
<code>\$Statement->fetchAll(int \$fetchStyle = PDO::FETCH_BOTH): array</code>	Fetch all results
<code>\$Statement->fetchOne(int \$fetchStyle = PDO::FETCH_BOTH): array</code>	Fetch single result
<code>\$Statement->rowCount(): int</code>	Return the number of rows

Doctrine Query Builder

<code>setParameter(\$parameter, \$value)</code>	
<code>addCriteria(Criteria \$criteria)</code>	
<code>[get/set]MaxResults(\$maxResults)</code>	
<code>[get/set]FirstResult(\$firstResult)</code>	

getQuery()

Learn to solve cryptic crosswords!
<http://crosswordcheats.com>

Doctrine raw SQL (cont)

```
$Statement->free(): void           Free stored result memory  
  
$connection = $entityManager->getConnection();  
  
$sql = 'SELECT * FROM events WHERE start_date >= :startdate';  
  
$statement = $conn->prepare($sql);  
$statement->bindValue('startdate', $startDate->format('Y-m-d H:i:s'));  
$statement->execute();  
  
return $statement->fetchAll();
```

Authorization

IS_AUTHENTICATE-D_FULLY	User has successfully authenticated, not via 'remember me cookie'
IS_AUTHENTICATE-D_REMEMBERED	All logged in users
IS_REMEMBERED	Only users authenticated using the remember me functionality
IS_IMPERSONATOR	When the current user is impersonating another user in this session

All roles you assign to a user must begin with the ROLE_ prefix in order for the default symfony RoleVoter to vote. Other prefixes require a custom voter.

Authorization in a controller

```
# Example of using wrapper #  
public function hello($name)  
{  
    // The second parameter is used to specify on what object the role is tested.  
    $this->denyAccessUnlessGranted('ROLE_ADMIN', null, 'Unable to access this page!');  
    // ...  
}  
  
# Example of using AuthorizationChecker  
use Symfony\Component\Security\Core\Authorization\AuthorizationCheckerInterface  
use Symfony\Component\Security\Core\Exception\AccessDeniedException;  
public function hello($name, AuthorizationCheckerInterface $authChecker)  
{
```

Authorization in a controller (cont)

```
if (false === $authChecker->isGranted('ROLE_ADMIN')) {  
    throw new AccessDeniedException("Unable to access this page!");  
}  
// ...  
}  
  
# Example of using annotation #  
use Sensio\Bundle\FrameworkExtraBundle\Configuration\Security;  
/**  
 * @Security("has_role('ROLE_ADMIN')")  
 */  
public function hello($name)  
{  
    // ...  
}
```

Persisting Entities

```
// get the entity manager that manages this entity  
$em = $this->getDoctrine()->getManagerForClass(MyEntity::class);  
  
// create a new entity  
$entity = new MyEntity();  
  
// populate / alter properties  
$entity->setName('Default Entity');  
  
// tell Doctrine you want to (eventually) save  
$em->persist($entity);  
  
// actually executes the queries  
$em->flush();
```

Authorization via security.yaml

```
# config/packages/security.yaml  
security:  
    access_control:  
        # public access only for /
```

Authorization via security.yaml (cont)

```
- { path: ^/, roles: PUBLIC_ACCESS }
# public access to login page /login
- { path: ^/login, roles: PUBLIC_ACCESS }
# or require ROLE_ADMIN or ROLE_USER_ADMIN for
/admin/users*
- { path: '/admin/users', roles: [ROLE_USER_ADMIN, ROLE_A-
DMIN] }
# require ROLE_ADMIN for /admin*
- { path: '^/admin', roles: ROLE_ADMIN }
# authenticated users only to the rest /*
- { path: ^/, roles: IS_AUTHENTICATED_FULLY}
```

No limit on amount of URL patterns. Each is a regular expression.
First match will be used.

Prepend the path with ^ to ensure only URLs beginning with the pattern are matched.

Authorization in template

```
{% if is_granted('ROLE_ADMIN') %}
<a href="#">Delete</a>
{% endif %}
```

Create a new form in a controller

```
# Create a new form with a default name #
$form = $this->createFormBuilder($data)
->add('dueDate', null, array(
'widget' => 'single_text'))
->add('save', SubmitType::class)
->getForm();

# Create a form with a non-default name #
$form = $this->container->get('form.factory')
->createNamedBuilder(
'form1', FormType::class, $data)
->add('dueDate', null, array(
'widget' => 'single_text'))
->add('save', SubmitType::class)
->getForm();
```

Create a form from a class in a controller

```
# Create a form from a form class with a default name #
$form = $this->createForm(TaskForm::class, $data, array(
'action' => $this->generateUrl('target_route'),
'method' => 'GET',
));

# Create a form from a form class with a non-default name #
$form = $this->container->get('form.factory')
->createNamed('form1', TaskForm::class, $data, array(
'action' => $this->generateUrl('target_route'),
'method' => 'GET',
));
```

Form Options

'action' => "	Where to send the form's data on submission (usually a URI)
'allow_extra_fields' => false	Allow additional fields to be submitted
'error_mapping' => array('matchingCityAndZipCode' => 'city')	Modify the target of a validation error
'extra_fields_message' => 'This form should not contain extra fields.'	Validation error message if additional fields are submitted
'inherit_data' => false	Inherited data from parent form or not
'method' => 'POST'	HTTP method used to submit the form
'post_max_size_message' => 'The uploaded file was too large.'	Validation message for size of post form data

Form Options (cont)

```
'validation_groups' => false
Disable the Validation of Submitted Data
```

```
public function configureOptions(OptionsResolver $resolver) {
$resolver->setDefaults(array(
# Options go here #
));
}
```

Log Levels / Console Verbosity (OutputInterface)

emergency()	System is unusable.	VERBOSITY_QUIET (-1)	-q / stderr
alert()	Action must be taken immediately.		
critical()	Critical conditions.		
error()	Runtime errors that do not require immediate action but should typically be logged and monitored.	VERBOSITY_NORMAL (0)	
warning()	Exceptional occurrences that are not errors.	VERBOSITY_NORMAL (0)	(non) / stdout
notice()	Normal but significant events.	VERBOSITY_VERBOSE (1)	-v
info()	Interesting events.	VERBOSITY_VERBOSE (2)	-vv
debug()	Detailed debug information.	VERBOSITY_DEBUG (3)	-vvv

```
use Psr\Log\LoggerInterface;
```

```
public function index(LoggerInterface $logger) {
$logger->info('I just got the logger');
}
```

Console

bin\console	List available commands and show the Symfony version
server:run	Run the built-in web server
assets:install --symlink	Install bundle assets as a symlink or hardcopy
debug:autowire	Lists classes/interfaces you can use for autowiring
debug:config	Dumps the current configuration for an extension
debug:container	Displays current services for an application
debug:form	Lists classes/interfaces you can use for autowiring
debug:route	Displays current routes for an application

Usage:

```
php bin\console command [options] [arguments]
```

Options:

- h, --help Display this help message
- q, --quiet Do not output any message
- n, --no-interaction Do not ask any interactive question
- e, --env=ENV The environment name [default: "dev"]
- no-debug Switches off debug mode
- v|vv|vvv, --verbose Increase the verbosity of messages: 1 for normal output, 2 for more verbose output and 3 for debug

Basic form

```
class TaskForm extends AbstractType
{
    public function buildForm(
        FormBuilderInterface $builder,
        array $options)
    {
        $builder
            ->add('dueDate', DateType::class, array(
                'widget' => 'single_text',
            ));
    }
}
```

Basic form (cont)

```
'label' => 'Due Date',
'required' => false,
'attr' => array('maxlength' => 10),
'constraints' => array(new Length(
array('max' => 10)))
))
->add('save', SubmitType::class);
}

public function configureOptions(
OptionsResolver $resolver)
{
$resolver->setDefaults(array(
'method' => 'GET',
));
}
}
```

TwigBridge - Forms

<code>{{ form(view, variables) }}</code>	Render whole form
<code>{{ form_start(view, variables) }}</code>	Render start tag
<code>{{ form_errors(view) }}</code>	Render global errors
<code>{{ form_row(view, variables) }}</code>	Render all the fields
<code>{{ form_rest(view, variables) }}</code>	Render all other fields
<code>{{ form_end(view, variables) }}</code>	Render end tag + all other fields
<code>{{ form_row(view.field) }}</code>	Render field label, error and widget
<code>{{ form_label(view.field, label, variables) }}</code>	Render field label

TwigBridge - Forms (cont)

<code>{{ form_errors(view.field) }}</code>	Render field error
<code>{{ form_widget(view.field, variables) }}</code>	Render field widget
<code>{# render a label, but display 'Your Name' and add a "foo" class to it #}</code>	
<code>{# form_label(form.name, 'Your Name', {'label_attr': {'class': 'foo'}}) #}</code>	
<code>{# render a widget, but add a "foo" class to it #}</code>	
<code>{# form_widget(form.name, {'attr': {'class': 'foo'}}) #}</code>	
<code>{# render a field row, but display a label with text "foo" #}</code>	
<code>{# form_row(form.name, {'label': 'foo'}) #}</code>	

Response from a controller

<code>render(\$view, \$parameters, \$response = null)</code>	Render the template and return a Response
<code>json(\$data, \$status = 200, \$headers = array(), \$context = array())</code>	Encode data and return a Json response
<code>file(\$file, \$fileName = null, \$disposition = ResponseHeaderBag::DISPOSITION_ATTACHMENT)</code>	Return a file response
<code>redirectToRoute(\$route, \$parameters = array(), \$status = 302)</code>	Redirect to route
<code>redirect(\$url, \$status = 302)</code>	Redirect to external URL
<code>forward(\$controller, \$path = array(), \$query = array())</code>	Forwards the request to another controller

```
return $this->render('admin/post/show.html.twig', [
    'post' => $post,
    'delete_form' => $deleteForm->createView(),
]);
}

return $this->json($data);
```
