

### Greedy Algorithms

<b>Indicator</b>	Making locally optimal choices to find a global optimum, problems involving finding minimum/maximum values.
<b>Tips</b>	Prove the greedy choice property and ensure it leads to an optimal solution.
<b>Common Patterns</b>	Interval scheduling, activity selection, minimum spanning trees.
<b>Examples</b>	Activity Selection Huffman Coding Dijkstra's Algorithm

### Dynamic Programming (DP)

<b>Indicators</b>	Optimal substructure, overlapping subproblems, constraints involving maximum/minimum values, finding number of ways to achieve a target.
<b>Tips</b>	Use memoization or tabulation to store results of subproblems, break the problem into smaller subproblems.
<b>Common Patterns</b>	Subset sums, longest subsequences, edit distance.
<b>Examples</b>	Longest Common Subsequence ,Knapsack Problem, Coin Change Problem
