

API commandes

```
code import requests
import json
import pandas as pd
url = "url de l'api"
response = requests.get(url)
data = response.json()
print(data) # avoir une idée
du contenu et des variables
pd.json_normalize(data[vars])
```

pd.json_normalize() convertir le dictionnaire json en Dataframe

Exporter et recharger un modèle

```
import joblib # Mlflow solution
alternative
joblib.dump(model, "model.joblib")
model_recharge = joblib.load("model.joblib")
```

L'extension .joblib n'est pas importante, juste un repère
