

### AI fundamentals Cheat Sheet

by rentasticco via cheatography.com/177906/cs/38258/

	ci	

What Artificial intelligence (AI) is a field of computer science that focuses on creating machines that can perform tasks that typically require is AI? human intelligence, such as visual perception, speech recognition, decision-making, and language translation.

#### Timeline

- 1935 Alan Turing, a British logician and computer pioneer, did the earliest substantial work in the field of artificial intelligence
- 1940 Edward Condon displayed Nimatron, a digital computer that played Nim perfectly. Konrad Zuse built the first working program-cont-rolled computers.
- 1943 Warren Sturgis McCulloch and Walter Pitts published "A Logical Calculus of the Ideas Immanent in Nervous Activity," laying foundations for artificial neural networks.
- Alan Turing proposed the Turing test as a measure of machine intelligence. Claude Shannon published a detailed analysis of chess playing as search. Isaac Asimov published his Three Laws of Robotics
- John McCarthy, known as the father of AI, developed the programming language LISP and coined the term "artificial intelligence".
- The Dartmouth College summer AI conference was organized by John McCarthy, Marvin Minsky, Nathan Rochester of IBM, and Claude Shannon. McCarthy coined the term "artificial intelligence," and the conference is considered the formal founding of the field of AI
- 1957- Al flourished, and computers became faster, cheaper, and more accessible. Machine learning algorithms improved, and people got
   1974 better at knowing which algorithm to apply to their problem. Early demonstrations such as Newell and Simon's General Problem Solver and John McCarthy's Advice Taker showed the promise of Al.
- 1980s Al was reignited by two sources: an expansion of the algorithmic toolkit and a boost of funds. John Hopfield and David Rumelhart popularized "deep learning" techniques, which allowed computers to learn using experience. Edward Feigenbaum introduced expert systems, which used a knowledge base of rules to make decisions.
- 1990s Al research shifted toward practical applications, such as speech recognition, computer vision, and robotics. The development of the World Wide Web and the explosion of digital data created new opportunities for AI.

### AI fundamentals Cheat Sheet by rentasticco via cheatography.com/177906/cs/38258/

### Basics (cont)

2000s

Al experienced a resurgence, thanks to advances in deep learning, big data, and cloud computing. Companies such as Google, Facebook, and Microsoft invested heavily in Al research and development, leading to breakthroughs in natural language processing, image recognition, and game playing

### Classification of Al

Narrow

ΑI

ΑI

This type of AI is designed to perform a specific task with intelligence. It is the most common and currently available AI in the world of artificial intelligence. Examples of narrow AI include playing chess, purchasing suggestions on e-commerce sites, self-driving cars, speech recognition, and image recognition.

General

This type of AI is designed to perform any intellectual task with efficiency like a human. It is capable of understanding and learning any intellectual task that a human can perform.

Super Al

This type of AI is hypothetical and does not exist yet. It is capable of performing intellectual tasks that are beyond human capabilities.

### Capabilities of Al

Make

**Detect Anomalies** 

Predic-

tions

Comprehend speech

Analyze images

interact in natural ways

### Type 2 Al

Reactive Machines hese are the most basic types of AI that do not store memories or past experiences. They can only react to the current situation based on pre-programmed rules.

Limited

These types of AI can use past experiences to inform future decisions. They can learn from historical data and use that knowledge

Memory to make decisions.

Theory of Mind This type of AI can understand the emotions, beliefs, and intentions of others. It can predict the behavior of others based on their

mental state.

Self Aware This is the most advanced type of AI that can have consciousness and understand its own existence. It can have desires, needs,

and emotions.

### **Machine Learning**

Machine learning is an application of artificial intelligence that involves algorithms and data that automatically analyze and make decision by itself without human intervention. It describes how computer perform tasks on their own by previous experiences. Therefore we can say in machine language artificial intelligence is generated on the basis of experience.

**Supervised learning**: All systems that learn from labelled training data. Example: Email spam filter

Unsupervised learning: Al systems that learn from unlabelled data. Example: Clustering customer data.

Reinforcement learning: All systems that learn from the feedback of the environment. Example: AlphaGo.

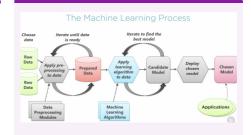

### **Supervised Learning**

Classific- Regression Time series ation forecasting

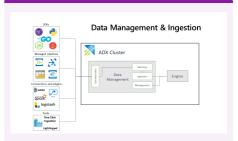

### Supervised Learning (cont)

to identify is a Time series the process of forecasting is the category finding the process of of new correlanalyzing time ations series data using observations on between statistics and the basis dependent modeling to make predictions of training and data. ## Interdependency and Key Features of Al (cont)

### Deep Learning

The subset of machine learning composed of algorithms that permit software to train itself to perform task, like speech and image recognition, by exposing multilayered neural networks to vast amount of data

### Key Features

of Al

1. Machine Learning

### 2. Deep Learning

3. Natural Language Processing

### 4. Computer Vision

- 5. Neural Network
- 6. Cognitive Computing

### Labelled and Unlabelled Data

Labelled Data	Unlabelled Data
Data that has some	Contains no tags
predefined tags such as	or no specified
name, type, or number.	name.
Used in Supervised	Used in Unsupe-
Learning techniques.	rvised Learning.
Difficult to get.	Easy to acquire.
e.g., An image has an apple or banana.	e.g., Anomaly detection,
	association rule
	learning.

### Labels and Features in Machine Learning

# Labels Features 1. Also known as tags 2. 1. Individu

Give an identification to a piece of data 3. Provide some information about that element.

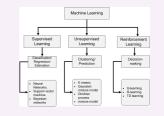

1. Individual independent variables. 2. Work as input for the ML system.

### **Unsupervised Learning**

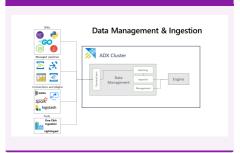

Clustering

An unsupervised learning method is a method in which we draw references from datasets consisting of input data without labeled responses. Generally, it is used as a process to find meaningful structure, explanatory underlying processes, generative features, and groupings inherent in a set of examples.

### **Types of Machine Learning**

### Data Ingestion
