Query

A query is a method called from the frontend that will retrieve some results from the backend.

A query will never update the data. Have a look at mutation for that.

Mutation

A mutation is like a query except that it is used for update and save mechanisms.
Other particularity: It is interpreted in queue not in paralells like query.

Type extend

```
type Cat extends Animal {
  name: String
  meows: Boolean
  purrs: Boolean
  scratches: Boolean
}
```
