

Cheatography

Java Midterm Cheat Sheet by sefergus via cheatography.com/31341/cs/9489/

String Methods

.toUpperCase()

.toLowerCase()

.substring(i,j) *j is excluded*

.length()

.compareTo(str)

Integer.parseInt(intString)

Double.parseDouble(doubleString)

import java.util.Scanner;

Scanner input= new Scanner(System.in);

Scanner Methods:

.nextLine() ends with line

.next() ends with white space

.nextDouble()

.nextInt()

Naming

keywords lowercase rule

variables camelCase convention

constants ALL_CAPS rule

class names CamelCase convention

Math Methods

Math.pow(a, b) Math.PI()

Math.log(x), Math.sqrt(x)

Math.log10(x)

Math.floor rounds down Math.ceil() rounds up

Math.random() Math.min(), Math.max()

import java.lang.Math;

has sin, cos, tan, toRadians, toDegree, asin, acos, atan

low + Math.random()* high (non-inclusive)

Escape Sequences

\t tab

\n newline

\" double quote

\\" backslash

Date Class

jav.util.Date date= new java.util.Date();

date.toString();

Point2D Class

import java.geometry.Point2D;

Point2D variable = new Point2D(x, y);

Objects

no variable constructor

constructor

constructor Circle (double radius) {
this.radius=radius;}

getter double getArea() {
return 2 x radius x radius x Math.PI; }

setter void setRadius(double radius) {
this.radius=radius;}

instanceof tests whether an object is an instance of a class

super(); calls no arg constructor of superclass

super(arg); calls matching arg constructor of superclass

;

Objects (cont)

array of objects for (int i, i<thing.length, i++)
array[i]= new Thing(param);}

"this.radius" is an instance variable, as is the original data field
"radius" is the local variable

constructors must have same name as class
constructors do not have a return type, not even void

constructors are invoked using the new operator when an object is created

default constructor goes to class with no other constructors defined

Abstract Classes and Interfaces

Abstract Classes

cannot use "new" only has abstract methods

methods have no body no constructors

mix of abstract/non-abstract methods "implements"

"extends" contains constants

has constructors

contains contacts and variables

public abstract class ClassName {

java.lang.Comparable
public interface comparable <E>{
public int compareTo(E o);
returns -1 for less than, 0 for equals,
1 for greater than

java.lang.Cloneable
public interface clonable {}
use .clone()

Loops

while int x=n;
while (x>1) {
change x; }

for for (int i, i<variable, i++){

for each (arrays) for (int i: list){

boolean (boolean ? true : false)

Cheatography

Java Midterm Cheat Sheet

by sefergus via cheatography.com/31341/cs/9489/

Characters

.isDigit(ch)	.isLetter(ch)
.isLowerCase(ch), .isUpperCase(ch)	.toLowerCase(ch), .toUpperCase(ch)

ArrayList Methods

create	ArrayList<type> name = new ArrayList<type>();
access element	list.get(i)
update element	list.set(i, e)
return size	list.size()
add element	list.add((i), e)
remove element	list.remove(i or e)
remove all elements	list.clear()
import java.util.ArrayList;	

Important methods

```
modifier returnType  
methodName(params){  
  
public Class className{  
    public static void main (String[] args)  
  
Scanner input= new Scanner(System.in)  
System.out.println(line);  
  
public static type name (type param){  
    return type; }  
  
public boolean equals (Object o){  
    if (o instance Person){  
        Person p= (Person) o;  
        return this.name.equals(p.getName());}  
    }else{  
        return false;  
    }  
}  
  
public String toString(){  
    return "String";}  
  
to use a method from a different class:  
Class.method(var);
```

Array methods

java.util.Arrays.sort(array)	.length
java.util.Arrays.equal(a1, a2)	if corresponding elements are the same
Arrays.toString(array)	.reverse()
array[i]	array[i]=e
import java.util.Arrays; int[] values= new int[10] default values: 0, /u0000, or false printing gives reference methods can modify arrays import java.util.Arrays; multi-dimensional arrays: arrays of arrays. elementType [rows] [columns] arrayVar	

Vocabulary

composition	information belongs to one object
association/selection	information can belong to many objects
public visibility	can be seen anywhere in any package
private visibility	can be seen within class
protected visibility	in package and subclasses of this in any package
runtime error	crash
compile error	doesn't run
final static	constant modifier
byte	8 bits*
block	/* ... */
comment	
line comment	//
javadoc	/** ... */
comments	
break;	breaks out of a loop
continue;	stays in loop
variable	creating a variable with its type declaration

Vocabulary (cont)

static	shared by all instances of a class
relational operator	<, <=, ==, !=, >, >=
logical operator	!, &&, (inclusive), ^ (exclusive)
Numeric Types (in order)	byte, short, int, long, float, double
Variable Scope	variables only exist within {}
assignment operators	=, +=, -=, *=, /=, %=
operators	+, -, %, / (truncates for int)
increment/decrement operators	++, --
instance method	a method that can only be invoked from a specific object
local variable	within a method
instance variable	dependent on the specific instance (class)
overloading methods	methods can have the same name as long as their method signatures are different
binary operators are left-associative, assignment operators are right associative
