

Terminal

```
# grep -lir '<s ear ch>'          Find text in files
<di r>
# grep -rn '<s ear ch>'          ... with line number and
<di r>                             preview
# sed -n 20,30p somefi -         show lines in a file
le.txt
```

Git

```
# git checkout -- .             Undo my changes
# git commit -am '...'         if you haven't added
                                any new files and you
                                want to commit
# git remote set-url origin     Reset the origin
http://<USER NAME>@sta-
sh.example.com/ repo.git
```

Git - working with others

```
# git add -A .
# git commit -m '...'
# git pull
// solve conflicts
# git push
```

(When your working with someone on git)

Vim

```
# vim ...                       open file
Esc :q                           quit
Esc :q!                          shit I've done something wrong
i                                 edit file
Esc :w                            save changes
Esc :x                            save and exit
dd                                delete line
dG                                delete ALL lines
Esc :e                            reload file
/...                             search for text
* (on a word)                    search for that word
Esc :noh                          clear search
Esc :set autoread                 Live reloads
```

Copy Text

```
v                                start copy
y                                end copy
(d)                             (cut text)
p                                paste
for :find to work include :set path=., /usr/include -
e, , ** in your ~/.vimrc file
```

Linux

```
Apache Logs                      /var/logs/httpd/
```
