

### Common Syntaxes

Print a string	<code>print ("hello world)</code>	hi
Make a comment	<code>#this is a comment</code>	
Print new Line	<code>\n</code>	
Convert other data type to string	<code>str(argument)</code>	
Creating a new variable	<code>name_of_variable = function</code>	

### Operation with List (array)

Description	Syntax (Code)	Print Console
Creating a list	<code>daily_temp = [80,90,54]</code>	Remember, Index starts with 0
Print out a particular index	<code>print(daily_temp[2])</code>	54
Reassigning a new value to particular index	<code>daily_temp[2] = 100</code>	[80,90,100]
Printing each index using a for loop	<code>for i in range 3: print(daily_temp [i])</code>	80 90 100
To get the length of the list and assign to a variable	<code>x = len(daily_temp)</code>	x:3
To print a list without a definitive length	<code>for i in range(len(daily_high_temps)): print(daily_high_temps[i])</code>	80 90 100
Second easier way to loop and print through a list	<code>for i in daily_temps: print(i):</code>	80 90 100
