Common Syntaxes

Print a string	`print ("hello world)`	hi
Make a comment	`#this is a comment`	
Print new Line	`\n`	
Convert other data type to string	`str(argument)`	
Creating a new variable	`name_of_variable = function`	

Operation with List (array)

Description	Syntax (Code)	Print Console
Creating a list	`daily_temp = [80,90,54]`	Remember, Index starts with 0
Print out a particular index	`print(daily_temp[2])`	54
Reassigning a new value to particular index	`daily_temp[2] = 100`	[80,90,100]
Printing each index using a `for` loop	`for i in range 3:` ` print(daily_temp [i])`	80 90 100
To get the length of the list and assign to a variable	`x = len(daily_temp)`	x : 3
To print a list without a definitive length	`for i in range(len(daily_high_temps)):` `print(daily_high_temps[i])`	80 90 100
Second easier way to loop and print through a list	`for i in daily_temps:` `  print(i):`	80 90 100
