

# File Handling and Error Handling in Python Cheat Sheet by srinivas.ram via cheatography.com/183208/cs/38160/

## File Handling in Python

#### File Handling In Python:

It allows you to read and write files, which can be in any format such as text, CSV, JSON, or binary.

Python provides built-in functions to perform file handling operations such as opening, reading, writing, and closing a file.

#### Opening a file:

file = open("filename.txt", "r")

#### Reading a file:

content = file.read()

#### Writing to a file:

file.write("Hello, world!")

#### Closing a file:

file.close()

# **Error Handling In Python**

#### Common Error types

n Python, errors are also called exceptions, and they are raised when the program encounters an unexpected condition or situation that it cannot handle.

# SyntaxError

print "Hello World!" # missing parenthesis

## NameError

print(x) # variable x is not defined

# TypeError

print("5" + 5) # concatenation of string and integer

## IndexError

 $my_list = [1, 2, 3]$ 

print(my\_list[3]) # index 3 is out of range

## ValueError

int("hello") # cannot convert string to integer

## KeyError

my\_dict = {"a": 1, "b": 2, "c": 3}
print(my\_dict["d"]) # key "d" not found in
dictionary

#### ZeroDivisionError

print(5/0) # division by zero
