

Object class

Universal superclass, all methods should be overridden if default implement is not suitable.

`toString()` return memory address by default

`equals()`; same as `==` by default, compare memory address, not the content

`compareTo()` same as `<>` by default, memory address instead of content

`hashCode()` return unique integer mapping an object to a hash table.

`Objects.hash(Object... args)` a simple hash algorithm

`getClass()` polymorphic, return class name

overridden `equals()` usually means override `hashCode()` too to return the same integer if 2 object are the same.

Wrapper class

Wraps (boxing) or unwraps (unboxing) primary types to object type

1. for methods required object type as parameters

2. for java container classes require object items

`intObj = Integer (6)` boxing int into Integer

`int intObj.intValue()` unboxing

Wrapper object are immutable, final

8 wrapper class

Boolean	Byte	Character	short
Integer	Long	Float	Double

Wrapper class constructor

`public Xxx(xxx)` create from primitive

`public Xxx(String)` create from string

No default constructor;
All wrapper classes are final

Wrapper class methods

Overriden `toString()`, `equals()` and `compareTo()` methods based on object content value instead of memory address.

`obj.xxxValue()`: used to get primary values

`new Xxx(PARAM)`: Constructor

`X.parseXxx(String)`: parse values from string as primitive

`X.valueOf`: value from string as Wrapper class

wrapper class `equals()` check the type first, if not same type return false.

Math

`import static java.lang.Math.*;` all members are static

`Math.PI`

`Math.abs()`

`Math.power(base, exp)`

`Math.sqrt()`

`Math.random` [0,1)

`Math.round()` -0.5->0, -0.6->-1, 0.5->1

Math random numbers

`a*Math.random()+b` a for scale, b=shift

`(int)(Math.random*a)+b` [b,a-1)

`(int)((Math.random+1)-*a)+b` [b,a]

`(int)(Math.random*-20)+5` [5,24]

`(int)(Math.random*-21)+5` [5,25]

Java random number generators

`java.lang.Math.random()` double [0,1), need scale, shift, casting

`java.Util.Random;` flexible types & methods, reproducible

`java.secure.SecureRandom;` <=128bit, cryptographically secure

`java.util.concurrent.ThreadLocalRandom;` more efficient with multi-thread app
